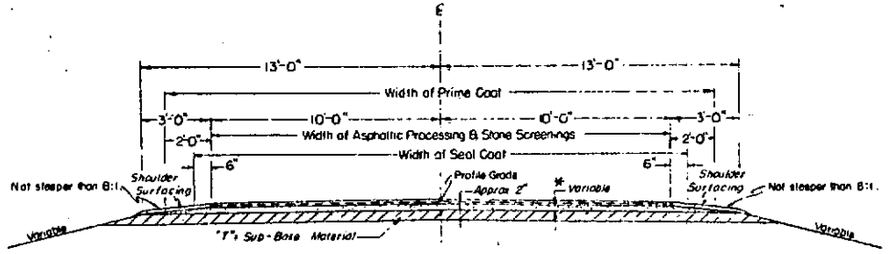
TYPICAL CROSS SECTION OF IMPROVEMENT AND SUMMARY OF QUANTITIES

Saguache - Gunnison County Line - South



Material above the subgrade is to be constructed of Sub-Base Material at locations designated in Sub-Base material tabulation. Estimated quantities involved in this operation and thickness of material required are tabulated in the Sub-Base material plan

The Profile Grade from Sta 1+39.7 to 126+00 & Sta. 151+00 to 522+00 is above the present roadway by the combined thicknesses of Bottom Course and Asphaltic Processing.

From Sta 126+00 to 151+00 it is above the present roadway by the combined thicknesses of Sub-Base Material, Bottom Course & Asphaltic Processing.

Approximate 4" and/or 6" compacted thickness of Gravel or Crushed Rock Surfacing shall be placed in separate courses at the following rates per 100 lin ft. of roadway:

Top Course		*23 tons*
Bottom Course	[2"	*26 tons*
	[4"	*51 tons*
Surfacing for Shoulder Areas		*7 tons*

GENERAL NOTES

This project is to be constructed in conformity with the Standard Specifications of the Colorado Department of Highways, adopted June 1, 1952.

All quantities on preliminary plans are to be considered approximate only.

For alignment and grades see projects FAS 369:B(1), 369-C(1), S-369(4) and S 0124(2).

All curves are to be superelevated and widened as provided by the Standard Superelevation sheet included with the plans, except that curves over 6 degrees shall be provided with the superelevation shown on the Standard Superelevation sheet for a 6 degree curve.

At the approaches to bridges, the present roadbed shall be excavated to provide for placing the required thickness of Surfacing and Sub-Base Material to meet the present grades at bridges. The transitions for this operation will take place gradually over a distance of 300 Ft. each way from the bridge ends. Excavated material shall be used to widen roadway shoulders at these approaches. The cost of removing and hauling material shall be included in the contract price for "Shaping Roadbed".

At bridge approaches, the Asphaltic Surfacing shall be widened to meet the curbed width of the bridge and shall take place gradually over a distance of 300 Ft. each way from the Bridge ends. The Prime Coat shall be widened beyond Mat as indicated on Typical Section.

It is estimated that rolling of Asphaltic Surfacing with Flat Wheeled Roller (Tandem) will be necessary after any rolling with Rubber Tired Rollers in order to provide a firm smooth surface.

All side approach roads to the project designated by the Engineer shall be primed and seal coated to approximately 50 feet out from edge of the Asphaltic Surfacing or to the Right of Way line, whichever is less.

The culverts and ditches are to be cleaned by the Saguache County Maintenance Forces at no cost to the project.

It is estimated that Shaping Roadbed will be required over the entire project.

* TABULATION OF BOTTOM COURSE THICKNESS

STATION			THICKNESS
1+39.7	to	15+00	4"
15+00	to	35+00	2"
35+00	to	65+00	4"
65+00	to	151+00	2"
151+00	to	170+00	4"
170+00	to	230+00	2"
230+00	to	250+00	4"
250+00	to	522+00	2"

For preliminary plan quantities of Asphaltic Road Materials and Stone Screenings, the following rates of application were used:

PRIME COAT	MC	at	0.40 Gals per Sq. Yd.
PROCESS	MC	at	0.70 Gals per Sq. Yd. per inch
SEAL COAT	RC	at	0.26 Gals. per Sq. Yd.
STONE SCREENINGS		at	200 Lbs. per Sq. Yd.

Rate of application and grade of Asphaltic Material shall be as determined by the Engineer at time of application.

It is estimated that material for Gravel Surfacing and Sub-Base Material for the project is available in the vicinity of the pit indicated in the following tabulations. Estimated quantities involved in these operations are shown below.

Alteration of these plans as here outlined will be allowed only on written permission from the Department.

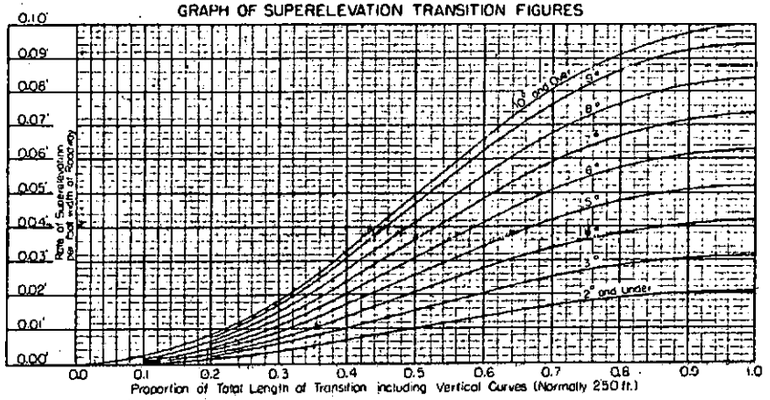
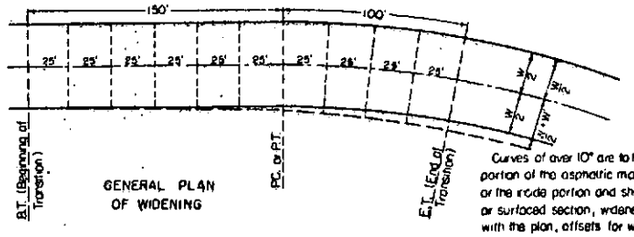
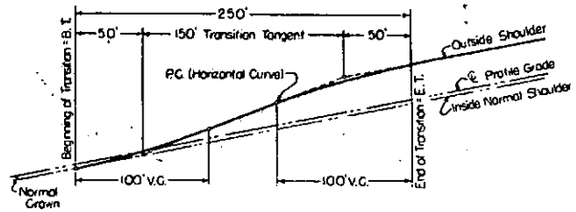
GRAPH OF SUPERELEVATION TRANSITION FIGURES





GENERAL PLAN OF WIDENING

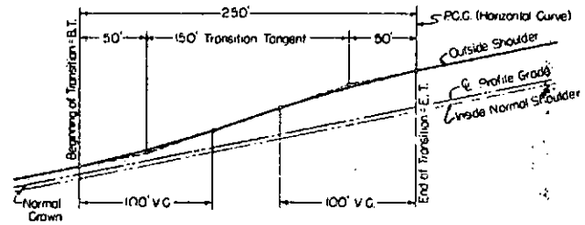
Curves of over 10° are to have the inside portion of the asphaltic mat and shoulder, or the inside portion and shoulder in a graded or surfaced section, widened in accordance with the plan, offsets for widening, and cross sections.



CASE I: SIMPLE CURVE WITH UNLIMITED TANGENT APPROACH

NOTE: CASE I

The transition in this case, from crowned section to superelevated section, shall proceed by raising the outside shoulder, over a distance of 250 ft. as shown, beginning at a point on the tangent 150 ft. from the end of the curve and acquiring full superelevation at a point 100 ft. inside the curve.



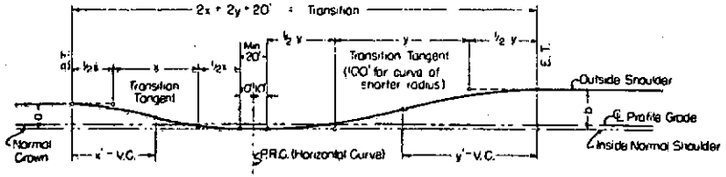
CASE II: COMPOUND CURVE

NOTE: CASE II

Superelevation transitions at the outside ends of compound curves shall be constructed in accordance with rules given under CASE I.

Superelevation transition between the arcs of different radii shall be made as in CASE I, except that the entire transition shall lie within the limits of the curve of the longer radius.

In cases where curves in the same direction have a tangent distance of less than 300 ft. between points of curve, the intervening tangent shall be superelevated an amount equal to that of the curve of greater radius and the transition shall be made as in the case of a true compound curve.



CASE III: REVERSE CURVES

NOTE: CASE III

Transitions between true reverse curves shall be accomplished as shown on the above diagram.

Transition tangents shall be directly proportional to the amount of superelevation of the respective curves

EXAMPLE: Let a represent the amount of superelevation on 1st. curve;
" b " " " " " " 2nd. " ;
" x " " " " transition tangent " 1st. " ;
" y " " " " " " 2nd. " ;

then, a:b = x:y.

The transition tangent of the curve having the shorter radius shall be set at 100 ft.

A normal crowned section 20 ft long, 10 ft. on each side of the P.R.C. shall be used.

In cases where curves in opposite directions are in such proximity that a standard transition can not be had, the practice outlined for true reversing curves shall be used.

The total distance between the P.T. of the first curve and the P.C. of the succeeding curve shall be prorated into the transition distance of the respective curves until a maximum of 150 ft. of transition tangent for each curve is achieved.

GENERAL NOTES

Curves on projects using the Section shown are to be superelevated and widened as indicated in the accompanying drawings and tables.

The normal inside edge of the Graded or Surfaced Section is to remain at the standard elevation of 0.02 ft per foot width of roadway below the profile grade, or as shown on the Typical Section for the Project. The centerline pivot point is to be used until the superelevation equals 0.02 ft per foot width of roadway. When this elevation is exceeded the normal inside shoulder pivot point is to be used.

When the degree of curvature exceeds 10°, the inside edge of the Asphaltic Mat or the inside shoulder of the Graded or Surfaced Section is to be widened from the normal inside edge or shoulder, respectively, as shown by the table and plan or by cross-sections. Curves of 10° or less are not to be widened.

The slope of the shoulders and widened sections shall conform to the rate per foot width of roadway required, except that the inside shoulder shall maintain the Typical Section slope until this slope is exceeded by the required superelevation slope.

The outside ditch on superelevated sections is to be modified, where necessary to provide proper drainage. Otherwise, this ditch shall conform to normal ditch section shown for Project.

The rate of superelevation per foot width of roadway to be applied at the outside shoulder of the roadway is computed as follows:

The full superelevation per foot width of roadway rate for a given degree of curvature is 0.0105 ft x Degree of Curvature.

The maximum superelevation of 0.10 ft per foot width, applying to curves of 10° and over, is not to be exceeded.

Where spiral curves are used, the transition from normal crowned section to full superelevation and widening shall take place over the full length of spiral curve.

Special transition problems not covered by this standard sheet shall be covered by appropriate notes included with curve data on plans.

REVISIONS

STANDARD SIDE APPROACH ROADS, FLARING, CUT SLOPE TREATMENT & WIDENING AT BRIDGES AND AT CREST OF GRADES

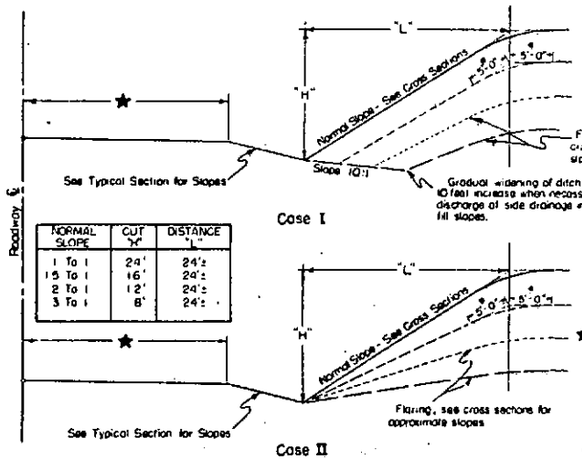
STANDARD M-2-EM

FED. ROAD DIV. NO. 8 | DISTRICT 6 | SHEET NO. 1 | TOTAL SHEETS 6 | SCALE

COLO. | SOLID YELLOW

Rev. 12-9-53, Details of Road Approaches, J.C.R

GENERAL DETAILS FOR FLARING OF EARTH CUTS, CUT SLOPE TREATMENT & WIDENING AT BRIDGES



NORMAL SLOPE	CUT "H"	DISTANCE "L"
1 To 1	24'	24'±
1½ To 1	16'	24'±
2 To 1	12'	24'±
3 To 1	8'	24'±

FLARING OF EARTH CUTS: The backslopes at ends of all earth cuts shall be flattened as where necessary the ditch shall be widened gradually to discharge side ditch drainage away from the base of adjacent fill slopes in order to avoid erosion & to improve appearance. The transition of flattened backslopes & widened ditch shall be constructed in such a manner that a uniform appearance of slope & ditch results. Backslopes shall be flared to the approximate "L" distance shown on Slope Table included with this detail. Rock cuts shall not be flared.

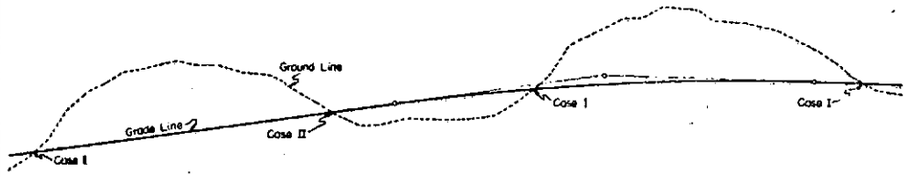
Flaring with widened ditch, see cross sections for approximate slopes.

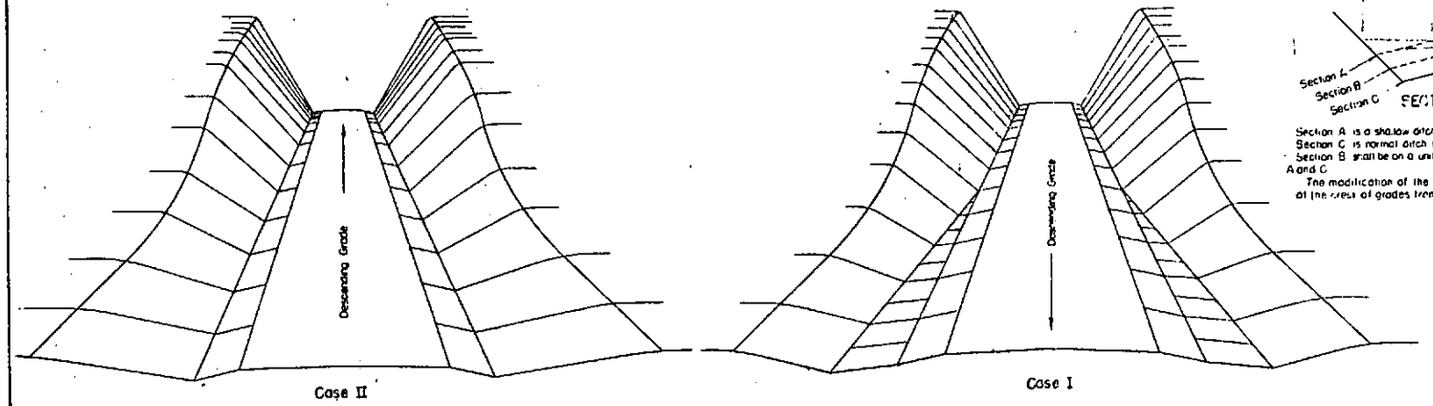
*CUT SLOPE TREATMENT IN EARTH CUTS: The intersection of cut slopes with the existing ground shall be rounded in earth cuts, beginning 5ft outside the slope stake and extending 5 ft down the cut slope. Where the cut slope is less than 5ft reduce each of the above widths of slope treatment to the actual slope distance. Quantities shall be included in "Unclassified Excavation".

★WIDENING AT BRIDGE APPROACHES: Roadway embankment at bridge approaches shall be so constructed that the finish point of the subgrade shoulder is a Min of 2ft beyond the outside edge of bridge rock. Where widening of the section is necessary to achieve this result it shall take place gradually over a distance of 300ft. This is done to accommodate guard fence and/or guard posts at bridge approaches. (See additional requirements for Guard Fences Table I)

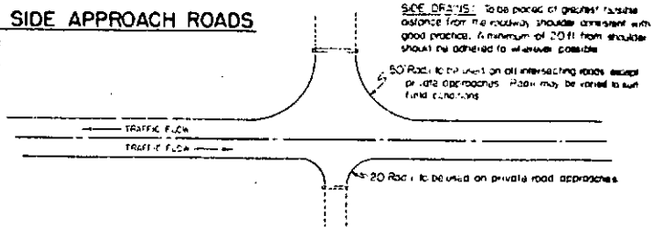
WIDENING TO ACCOMMODATE GUARD FENCES: At all locations on the project (except as provided above for bridge approaches) where guard fence is to be constructed the shoulders shall be widened 2ft. to provide additional lateral support for guard fence posts.

PLAN OF FLARING IN EARTH CUTS





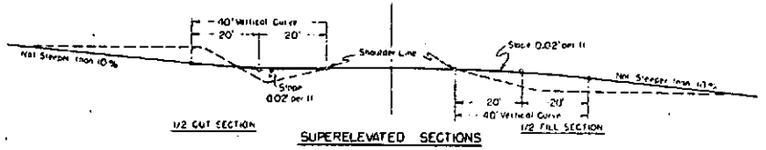
TYPICAL PLANS FOR SIDE APPROACH ROADS



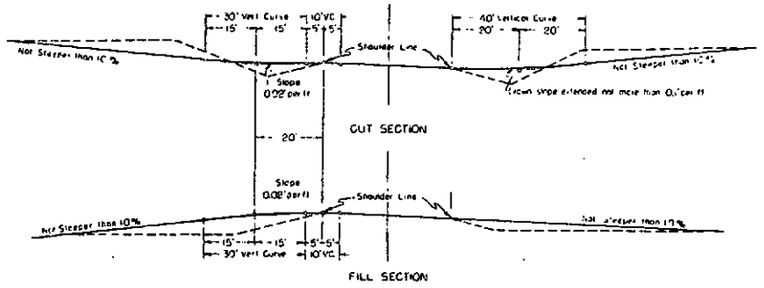
SIDE DRAINS: To be placed at greatest feasible distance from the roadway shoulder consistent with good practice. A minimum of 20 ft from shoulder should be adhered to wherever possible.

50' Radii to be used on all intersecting roads except private approaches. Radii may be varied to suit field conditions.

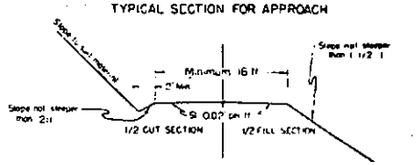
STANDARD CROWNED SECTION



SUPERELEVATED SECTIONS



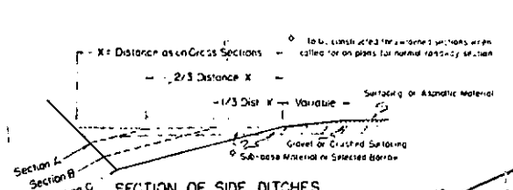
TYPICAL SECTION FOR APPROACH



NOTE:
ROAD APPROACHES: To conform to the above details unless otherwise indicated on plans or Special Details. The width of the crowned section shall be not less than the width of the crowned section of the existing approach road and in no case shall the new construction be less than sixteen (16) feet in width.

DETAILS FOR DITCH & WIDENED SHOULDERS AT CREST OF GRADES

(TO BE USED ONLY WHERE SIGHT DISTANCE AT CREST OF GRADE IS 600 FT OR LESS)



SECTION OF SIDE DITCHES

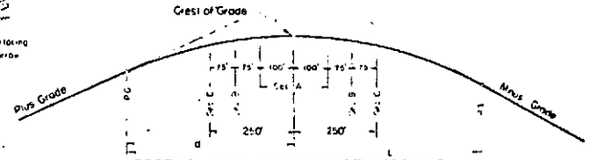
Section A is a shallow ditch section
Section C is normal ditch section.
Section B shall be on a uniform transition between Sections A and C
The modification of the ditch indicated shall be used only at the crest of grades from which drainage breaks both ways

Formula for finding the Crest of Grade

$a = \frac{\text{Plus Grade}}{\text{Algebraic DIFF}} \times L$

NOTE

Where section is of embankment at crest of grades, the shoulder shall be widened an amount equivalent to that used on ditch sections, thus providing a symmetrical section at the crests



PROFILE VIEW SHOWING DISTANCES AND RELATIVE POSITIONS OF DITCH-TREATMENT SECTIONS

GENERAL NOTES

All work shall be done in accordance with the Standard Specifications of the Colorado Department of Highways applicable to the Project.

All side approach roads to the Project shall be Gravel Surfaced with a four (4) inch thickness of "Gravel or Crushed Rock Surfacing" extending approximately to the Right of Way Line. Estimated tonnage & type of material required for this operation are shown in the Surfacing Plan.

The maximum grades shown are to be the limiting grades for all road approaches. Modifications of grades will be permitted where adherence to the grades as shown would cause damage to property or create other unsatisfactory conditions. Grades less than the maximum shown are to be used wherever feasible.

STANDARD ROADWAY CONSTRUCTION TRAFFIC SIGNS

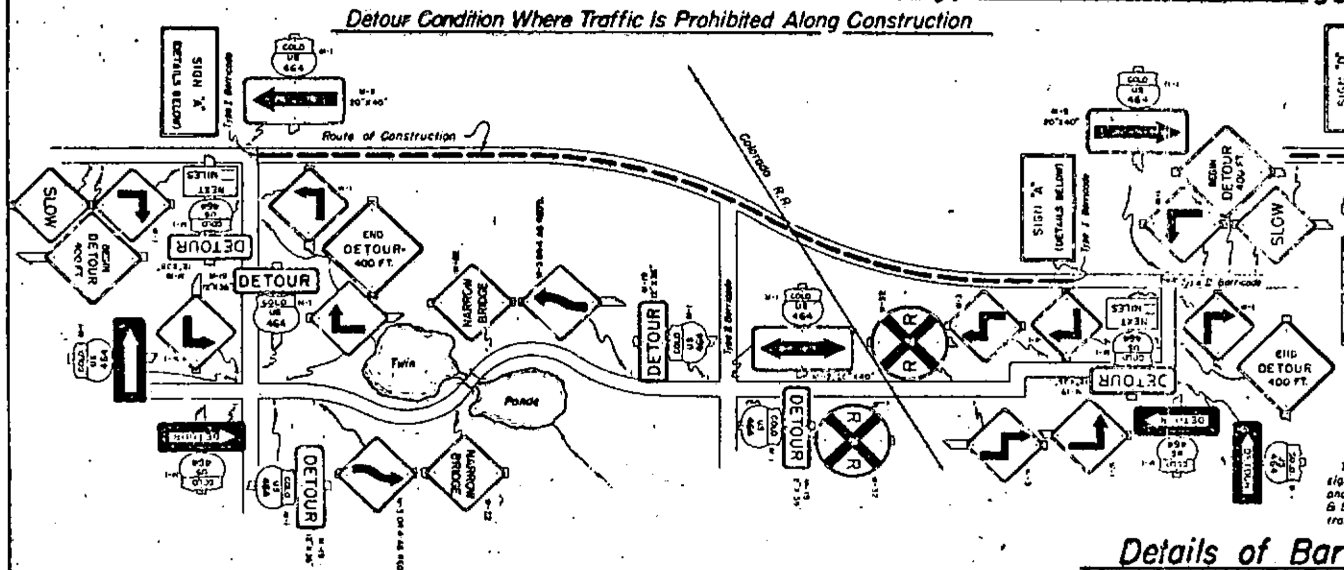
STANDARD M-29-A

FED. ROAD DIV. NO.	DISTRICT	[redacted]	SHEET NO.	TOTAL SHEETS
9	COLO.	[redacted]	[redacted]	

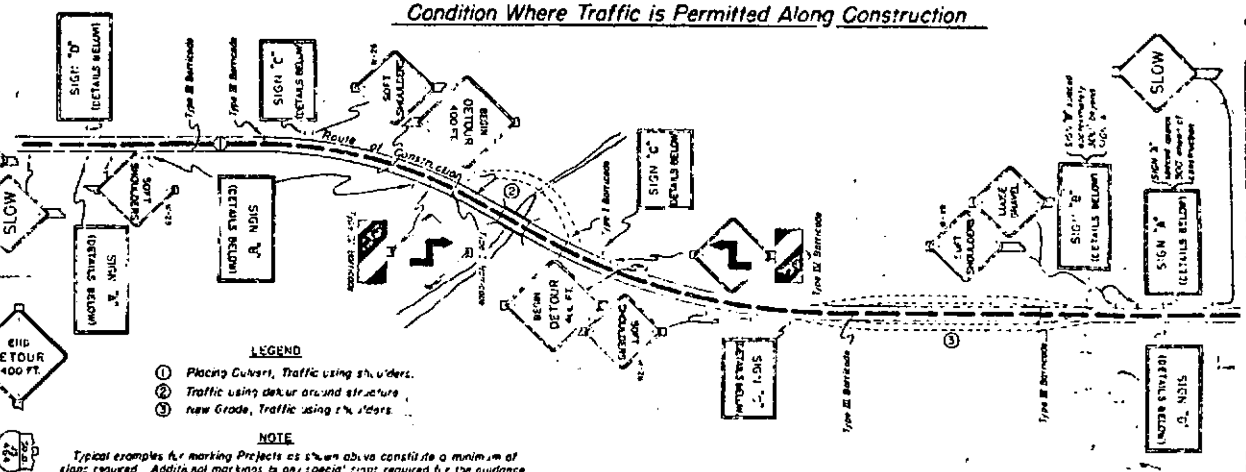
Rev 11-28-52, J C R
Rev 4-22-54, Scotchlite Spec's, J C R

Typical Methods of Marking Highways & Detours

Detour Condition Where Traffic Is Prohibited Along Construction



Condition Where Traffic is Permitted Along Construction



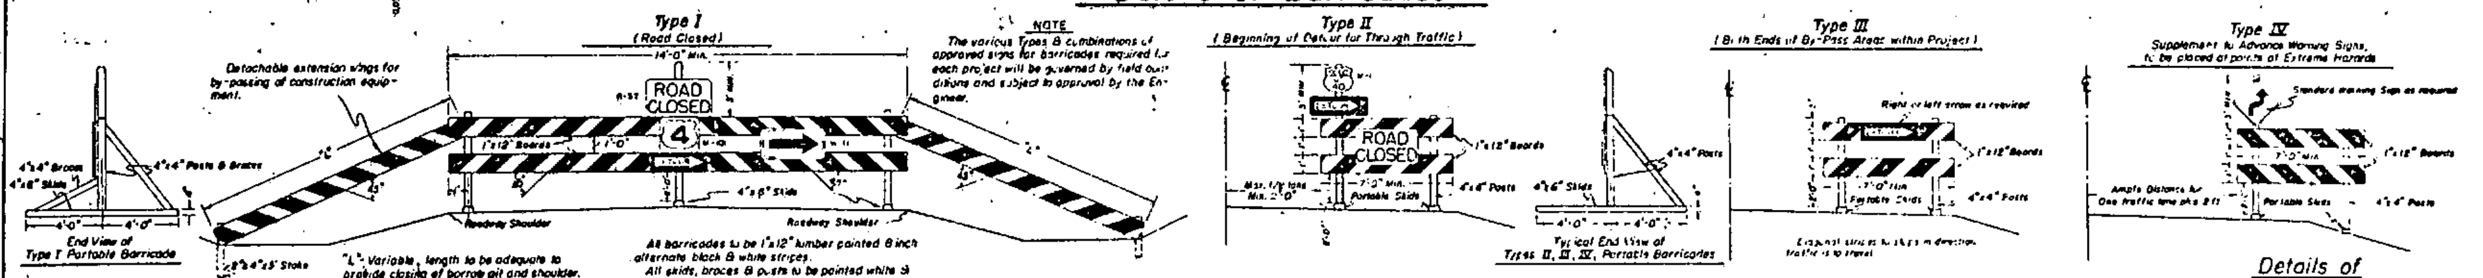
LEGEND

1. Placing Culvert, Traffic using shoulders.
2. Traffic using detour around structure
3. New Grade, Traffic using shoulders.

NOTE

Typical examples for marking Projects as shown above constitute a minimum of signs required. Additional markings & any special signs required for the guidance and protection of traffic will be placed as required along the project. Contractor's & Engineer's equipment must be parked so that signs & barricades are visible to traffic at all times.

Details of Barricades



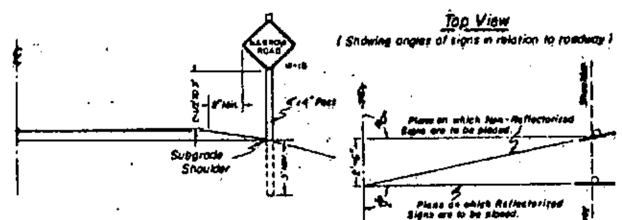
NOTE

The various Types & combinations of approved signs for barricades required for each project will be governed by field conditions and subject to approval by the Engineer.

"L"- Variable, length to be adequate to provide closing of borrow pit and shoulder.

All barricades to be 1"x12" lumber painted 8 inch alternate black & white stripes.
All skids, braces & posts to be painted white & nailed together with No. 20d nails.
Bases to be weighted where necessary to provide stability.

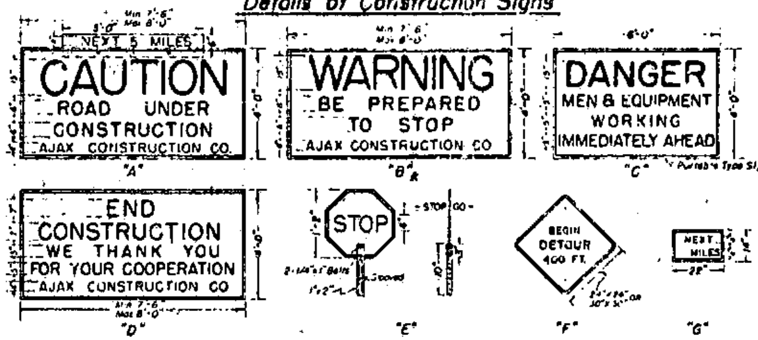
Position of Signs Relative to Roadbed & Hazards



NOTE

Warning Signs to be made of 1/4" (Min) plywood or No. 10 Gauge (Min) metal.
Location to be governed by field conditions. Exact location to be staked by the Engineer. In all cases warning signs are to be placed well in advance of hazard, the distance depending on topography, and existing approach speeds.

Details of Construction Signs



MARKINGS

Construction Signs "A", "B", "C", "D", "G" - to be of 1" material painted White, the words "CAUTION", "WARNING", "DANGER", and "WE THANK YOU FOR YOUR COOPERATION" lettered with Scotchlite (No. 2272 Red, or equal), balance of lettering to be Black.
Construction Sign "A"; to be provided with a detachable board mounted on back of sign with 2-1/4"x2" bolts. 1" material painted white, balance of lettering to be Black. (Miles indicated to the nearest Mile)
Flagman Warning Sign "E" - to be of plastic or other light weight material, painted Red with White lettering on the stop side & painted Green with White lettering on the go side. Handle to be grooved on one side to indicate reading of sign to the Flagman. To be used whenever flagmen are necessary. Sign to be reflectorized if used to stop traffic at night.

Detour Warning Sign "F" - to be of 1/4" (min) plywood or No. 10 (min) gauge metal, painted Yellow, all lettering to be Black.
Construction Sign "G" - 3/4"x9" metal slides to be placed between words "NEXT __ MILES", spaced so as to accommodate appropriate size numerals. Required numerals to be furnished by the Department and to be installed by the Contractor. Numerals calculated to nearest mile.
Signs to be fastened to 2-4"x4" posts set 4 ft. in the ground with a minimum of 3-1"x4" nailing strips on the back. Bottom of sign to be 24" above ground.

GENERAL NOTES

All work shall be done in accordance with the Standard Specification of the Colorado Department of Highways applicable to the project.

Where traffic is maintained through or over any part of the Project, the Contractor will be required to mark all hazards within the limits of the Project with well painted, well maintained Barricades, Warning Signs and Directional Type Signs. All Barricades & Signs shall be moved, added to, changed or removed as required during the progress of construction and removed entirely when project is completed.

All Warning & Directional Type Signs will be "Reflectorized" with "Scotchlite" Reflective Sheeting or a suitable equivalent. Except for variations noted on this sheet all signs will be in conformity with the specifications outlined in "Manual on Uniform Traffic Control Devices for Streets & Highways" issue of August 1948 by the U.S. Public Roads Administration. U.S. or State Route Markers required for the Project will be furnished by the Department and installed by the Contractor. Numbers adjacent to signs refer to Standards in the Manual.

The Contractor shall furnish & install the following as required within the limits of the Project:

1.	All Barricades	As Required
2.	"CAUTION, ROAD UNDER CONSTRUCTION, NEXT __ MILES, CONTRACTORS NAME"	Minimum 2
3.	Standard Warning & Directional Signs	As Required
4.	"WARNING, BE PREPARED TO STOP, CONTRACTORS NAME"	Minimum 2
5.	Approved Directional Arrows for Barricades	As Required
6.	"DANGER, MEN & EQUIPMENT WORKING IMMEDIATELY AHEAD"	Minimum 2
7.	"END CONSTRUCTION, WE THANK YOU FOR YOUR COOPERATION, CONTRACTORS NAME"	Minimum 2
8.	Torches and Flares as follows: Type I Barricades	Minimum 3
	Type II, III & IV Barricades	Minimum 1
	Standard Warning Signs	Minimum 1

Where traffic is prohibited from the Project, the Detour will be marked by the Department except for Barricades complete with approved Warning Signs & Arrows which will be provided, erected & maintained by the Contractor at ends of Project and intersecting roads.

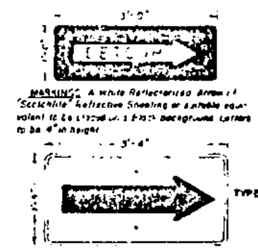
All lumber used shall be of sound durable material. Barricades, Signs, Symbols & Lettering conforming to styles noted hereon will be well painted & maintained. Uneven or smeared lettering will not be accepted.

Flares and Torches shall be of the Oil burning Type approved by the Department and shall be placed 3 ft. to 5 ft. ahead of the object to be illuminated. Particular care shall be taken to protect all signs and barricades from smoke and smudge arising from torches and flares.

All signs are to be in clear view of traffic and are not to be obstructed by equipment, weeds or otherwise.

Speed control signs as required, may be requested from the Engineer by the Contractor.

Details of Reflectorized Arrows



MARKINGS: A White Reflectorized Arrow of "Scotchlite" Reflective Sheeting or a suitable equivalent to be placed on a Black background. Letters to be 4" in height.

MARKINGS: A Black Arrow on a "highway yellow" background of "Scotchlite" Reflective Sheeting or suitable equivalent.

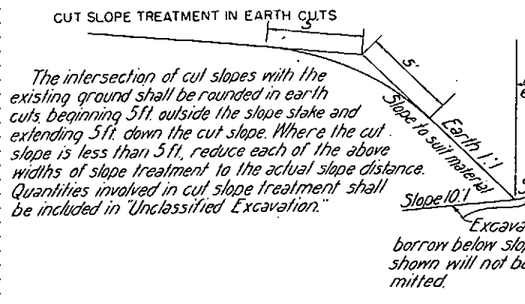
Revised Summary of Approx. Quant. 6-9-41 - w.d.w.

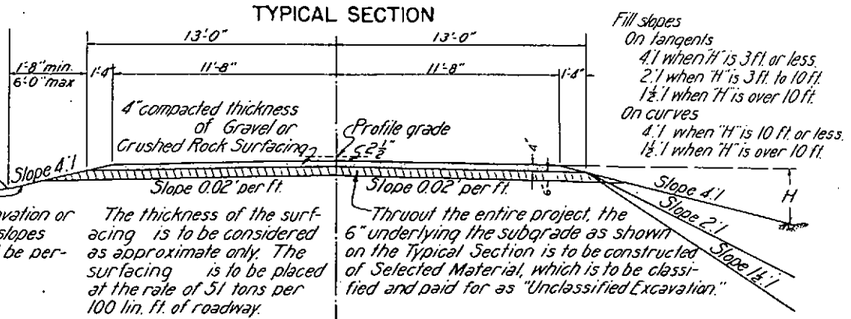
TYPICAL CROSS SECTION OF IMPROVEMENT AND SUMMARY OF QUANTITIES

CUT SLOPE TREATMENT IN EARTH CUTS



The intersection of cut slopes with the existing ground shall be rounded in earth cuts beginning 5 ft. outside the slope stake and extending 5 ft. down the cut slope. Where the cut slope is less than 5 ft. reduce each of the above widths of slope treatment to the actual slope distance. Quantities involved in cut slope treatment shall be included in "Unclassified Excavation."

TYPICAL SECTION



Fill slopes
On tangents
4:1 when "H" is 3 ft. or less.
2:1 when "H" is 3 ft. to 10 ft.
1½:1 when "H" is over 10 ft.
On curves
4:1 when "H" is 10 ft. or less.
1½:1 when "H" is over 10 ft.

The thickness of the surfacing is to be considered as approximate only. The surfacing is to be placed at the rate of 51 tons per 100 lin. ft. of roadway.

Thruout the entire project, the 6" underlying the subgrade as shown on the Typical Section is to be constructed of Selected Material, which is to be classified and paid for as "Unclassified Excavation."

½ CUT SECTION ½ FILL SECTION

NOTE: Roadway embankments at bridge approaches shall be so constructed that the finish point of the gravel shoulder is 3 ft. outside the curb line of the bridge. Where widening of the section is necessary to achieve this result, it shall take place uniformly over a distance of 300 ft. This is done to accomodate guard fence or guard posts at bridge approaches.

GENERAL NOTES

This Project is to be constructed in conformity with the Standard Specifications of the Colorado State Highway Department, adopted June 1, 1940.

All quantities on preliminary plans are to be considered as approximate only.

All roadway excavation required to construct this project is to be obtained as indicated on the plans. All quantities involved beyond the limits of the ditch as shown on Typical Section, either noted on the profile as "Borrow" or on the List of Structures as "Embankment" are to be classified and paid for as "Unclassified Excavation." These quantities are to be staked as part of the original excavation at locations indicated on the plans. Slope stakes beyond the limits of the Typical Section are subject to change by the Engineer to fit embankment requirements actually encountered on construction.

All poles encroaching on construction are to be moved by owners.

All corrugated metal pipe cross culverts are to be provided with one headwall on the inlet end unless otherwise noted on the plans. The ends of corrugated metal culvert pipes, which are not provided with headwalls, shall be covered with approximately 6" of material in such manner that a minimum of metal shall be exposed in the completed work. This shall be accomplished by warping embankment slopes around and adjacent to the culvert.

All side approach roads to the project shall be gravel surfaced with a 4" thickness of "Gravel or Crushed Rock Surfacing" extending approximately 30 ft. from the edge of the highway. Estimated tonnage of surfacing material required in this operation is shown on the List of Structures.

Overhaul will be paid for as measured along the center line of the project, except as otherwise noted on the plans.

All curves are to be superelevated and widened as provided for by the Standard Superelevation sheet included with the plans.

All wire fences, including line posts, shall be placed approximately six (6) inches inside the highway right of way as shown on the plans.

The present traveled roadway will be used for traffic during the construction of this project. Between Sta. 206+ and 209+ the contractor shall construct detour on the right as noted on plans. At all other places on the project where new construction encroaches on the present traveled roadway traffic shall be adequately provided for at the contractor's expense. Also, the contractor shall, at his own expense, construct and maintain in safe condition all temporary approaches to and crossings of intersecting roads.

PROTECTION OF FILL SLOPES

At all places on this project where toe of embankments, on stream side, extend into present stream bed, such toes of embankments shall be constructed of large rocks and boulders from adjacent cuts. Rock and boulders shall be placed in toes of embankments on stream side to a minimum height of five (5) feet above stream bed. The embankments at the approaches to each end of bridge, station 208+, are to be constructed of rock from adjacent cuts.

Actual overhaul on this material will be allowed and paid for. All other costs of this work shall be included in the unit price bid per cubic yard for Unclassified Excav.

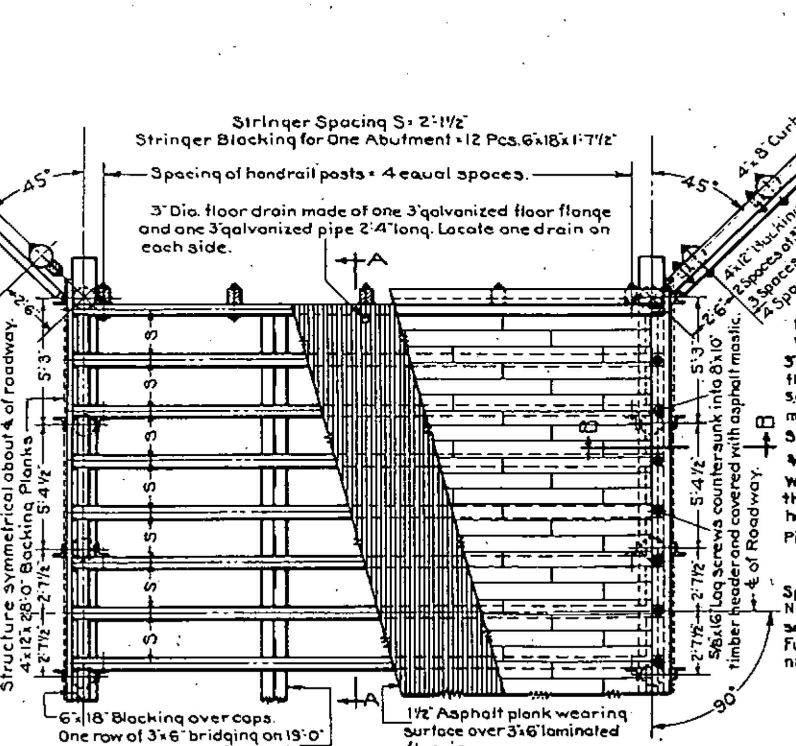
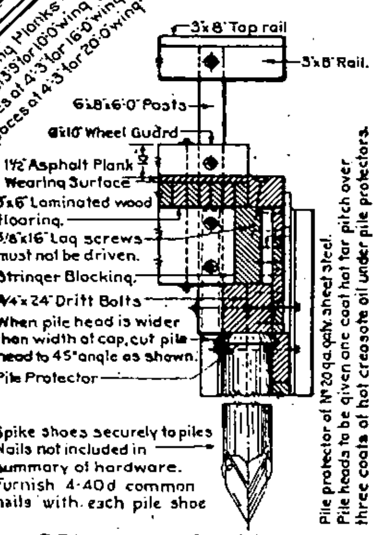
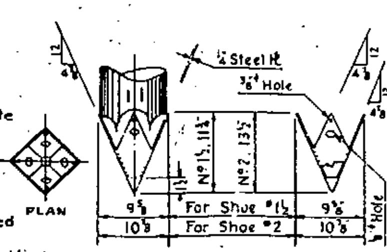
DETAIL OF CONNECTION ANGLES



SECTIONAL PLAN



SECTION THRU ABUTMENT



DETAIL OF PILE SHOE

Furnish American Pulley Co's. Pile Shoe or equivalent. Where pile shoes are specified use No. 1 1/2 shoe for pile tips ≥ 9" and No. 2 shoe for pile tips > 9". Wt. No. 1 1/2 8 lbs., Wt. No. 2. 13 1/2 lbs.

GENERAL NOTES.

All work shall be done according to the Standard Specifications of The Colorado State Highway Department. Adopted June 1 1940.

All timber and piling to be treated or untreated as shown in bills of material.

All timber and piling shall be dense southern yellow pine or west coast douglas fir.

All caps shall be edged to an even depth before treatment. The ends of all stringers shall be dapped on one edge before treatment, to obtain an even depth over caps.

All cut surfaces or bored holes in treated timber or piles shall be thoroly saturated with hot creosote oil.

All piling supporting caps shall be covered with galvanized pile protectors as specified, all other piling tops shall be saturated with hot creosote oil and covered with a thick layer of heavy asphalt or tar.

Joints in top handrail must be staggered with joints in side rail.

All handrailing and posts above the wheel guards shall be painted white and all handrail posts below the top of wheel guards shall be painted black as specified.

All bolts more than 12" long must be threaded not less than 4 inches.

Bolts in the finished structure shall not project more than one half inch beyond the nut.

All bolts must have Std. C.I.O.G. or Malleable Cast Washers under each head and nut.

Bolt lengths are calculated assuming Std. C.I.O.G. washers will be used.

The contractor is cautioned to check bolt lengths before ordering because of variations in thickness of lumber and piling.

The entire exposed surface of all untreated timber shall be painted one coat as specified imediately after the material is delivered to the project.

Before placing handrailing the contact surfacing shall receive the second coat of paint.

When contractor is permitted to drill holes to facilitate pile driving, these holes must be drilled so piling will stand in vertical position after final driving.

Bid price for asphalt plank shall include galvanized barbed nails and necessary asphalt mop.

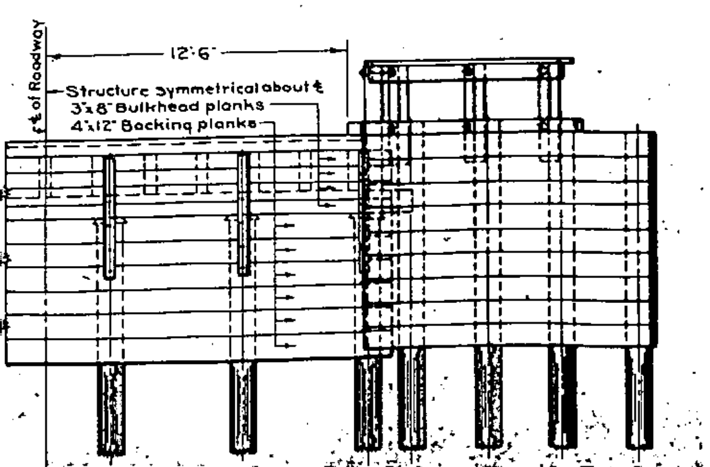
All hardware to be galvanized. Weights of hardware as shown are for ungalvanized material.

All necessary blocking for swaybracing shall be treated timber.

All caps must be surfaced on vertical grain face.

GENERAL NOTES (CONT.)

Contractors' attention is called to Specifications covering Mechanical Tamping. Special care must be used to prevent deflection of abutments and wings by wedging action. Backfill in 6 in. earth layers shall be mechanically tamped beginning at the wall and proceeding outward and downward therefrom at a 4:1 min. slope. Below channel elevation mechanical tamp uniformly on both sides. Above original ground line mechanical tamp out to 6 ft. from the wall. Rolling equipment shall not be used within



HALF END ELEVATION
See bill of material for number of backing planks required.

GENERAL NOTES

ALL WORK SHALL BE DONE ACCORDING TO THE STANDARD SPECIFICATIONS OF THE COLORADO STATE HIGHWAY DEPARTMENT.

ALL CONCRETE SHALL BE CLASS "A."

FORMS FOR CONCRETE SURFACES EXPOSED IN THE FINISHED WORK SHALL BE CONSTRUCTED OF SHIPLAP, OR TONGUE AND GROOVE LUMBER S3S UNLESS FACED WITH PANEL BOARD.

CONCRETE GIRDERS, FLOOR SLABS AND CURB SHALL BE POURED MONOLITHICALLY. FOOTINGS IN ROCK SHALL BE POURED OUT TO THE ROCK AND NOT FORMED.

ALL REINFORCING BARS SHALL BE DEFORMED AND TAGGED WITH THE STATION NUMBER AND LETTER DESIGNATION. MAIN BARS SHALL NOT BE SPLICED.

SOUNDINGS AND DEPTH OF FOOTINGS SHOWN ARE ACCORDING TO THE BEST AVAILABLE DATA. IF ESSENTIALLY DIFFERENT CONDITIONS ARE ENCOUNTERED THE BRIDGE ENGINEER WILL INSPECT AND DETERMINE IF REDESIGN IS NECESSARY."

ALL RIVETS TO BE ¾" DIA. ALL RIVETS TO BE POWER DRIVEN.

NOTE: Mechanical Tamping as provided under Item 14 of the specifications shall be applied over such areas as shown on the plans or as ordered by the Engineer.

GENERAL NOTES FOR ALL STRUCTURES

All work shall be done according to the standard specifications of the Colorado State Highway Department, adopted June 1-1940.
All concrete shall be class "A" except types A & B, which shall be class "B"
All exposed surfaces shall be rubbed free of form marks.
All exposed corners shall be beveled to a 2" face
All construction joints shall be thoroughly cleaned before fresh concrete is poured.
All walls shall have forms on both sides.
All reinforcing bars shall be deformed.
All reinforcing bars shall tagged with the station number & letter designation
Secondary bars when spliced shall be given a lap of 50 diameters.
Main bars shall not be spliced.
Minimum fill over top of culverts shall be 1'-0".
When culvert is skewed, headwalls shall be placed parallel to ℄ of roadway
Minimum grade of pipe shall be 1%
For size and location of culverts see sheet No. 2.
Footings in rock shall be poured out to the rock and not formed.

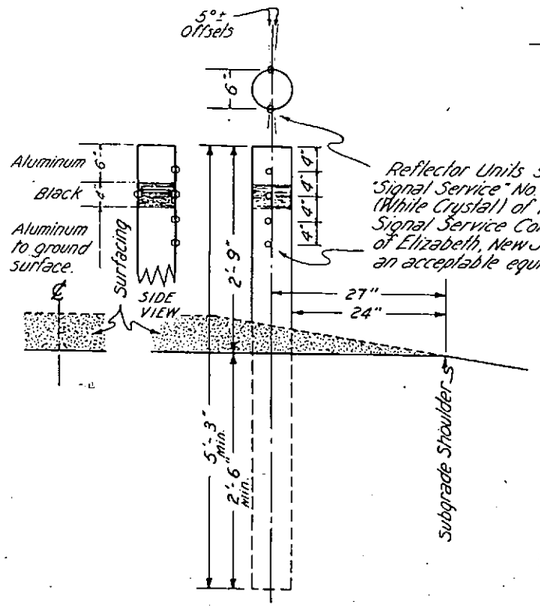
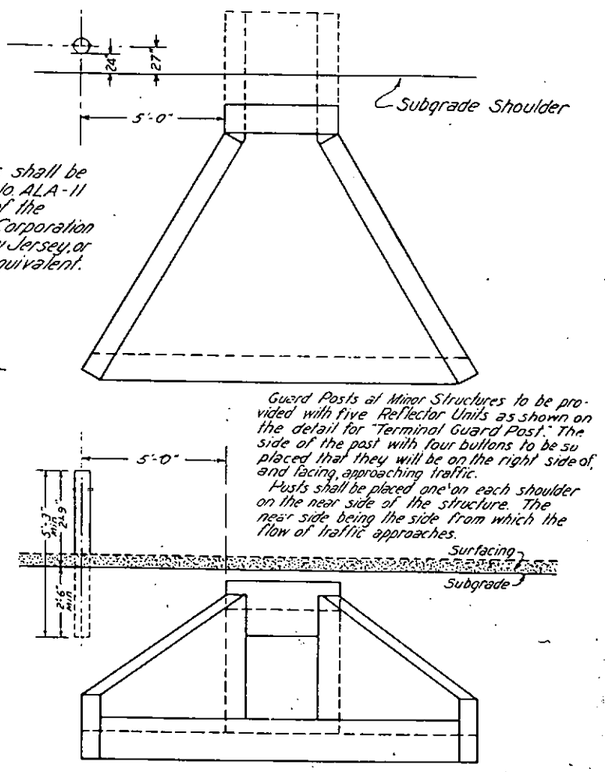
SHOWING PLACEMENT ON NORMAL ROADWAY FILLS



TERMINAL GUARD POST

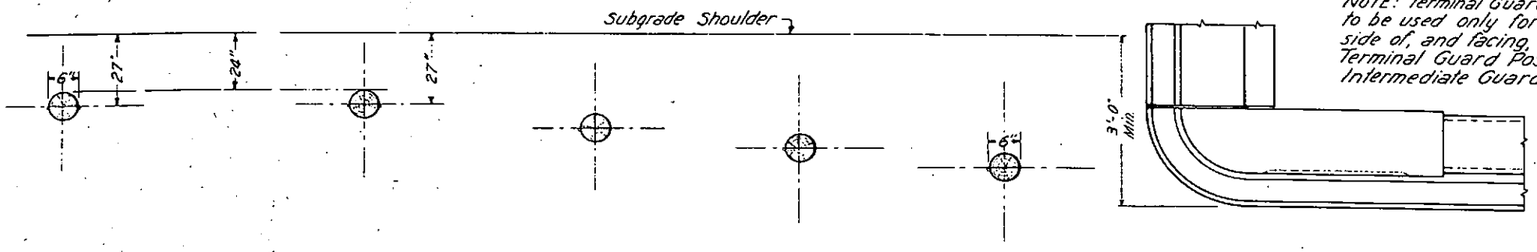
NOTE: Terminal Guard Posts as detailed above to be used only for the near Post on the right side of, and facing, approaching traffic. All other Terminal Guard Posts to be identical with Intermediate Guard Posts.

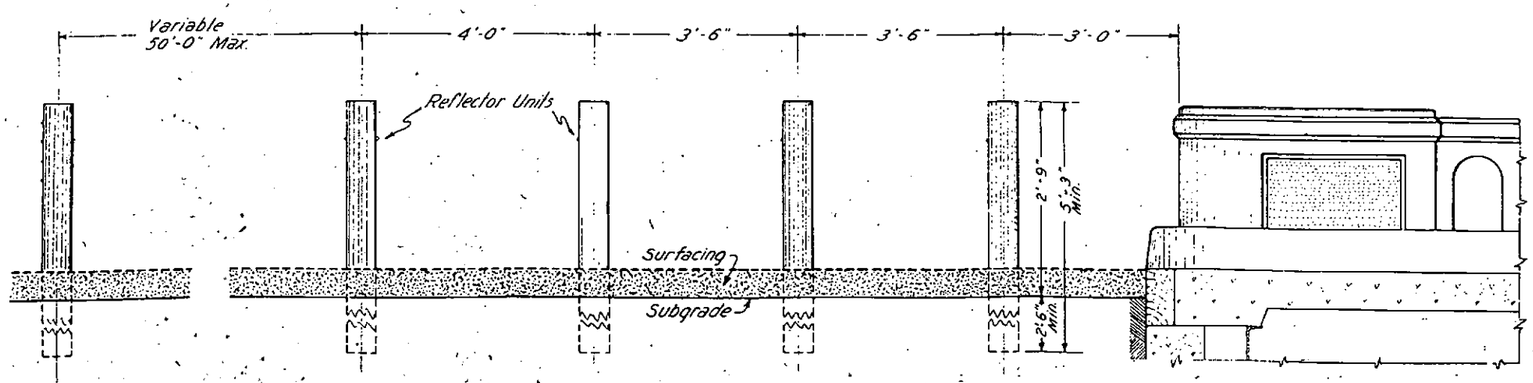


Guard Posts at Minor Structures to be provided with five Reflector Units as shown on the detail for "Terminal Guard Post." The side of the post with four buttons to be so placed that they will be on the right side of, and facing, approaching traffic.

Posts shall be placed one on each shoulder on the near side of the structure. The near side being the side from which the flow of traffic approaches.

SHOWING PLACEMENT AT MINOR STRUCTURES





SHOWING PLACEMENT AT BRIDGE APPROACHES

Intermediate Guard Posts at Bridges to be provided with Reflector Units as shown; that is, one unit each on the three Posts nearest the bridge end and two Units on the fourth Post.

GENERAL NOTES

All work shall be done in accordance with the Standard Specifications of the Colorado State Highway Department, adopted on June 1, 1940.

All wood posts shall be made from seasoned, straight, sound Lodgepole Pine, Southern Yellow Pine, or West Coast Douglas Fir.

No section of wood posts shall be less than 6" in diameter.

All wood posts shall be entirely peeled and shaved, thoroly seasoned and dry, with square tops.

All wood posts shall be set and tamped in plumb and firm, to the lines and grades as directed by the Engineer.

Reflector Units in all posts shall be placed in such position that the units will function at a distance of 300 feet.

On tangents the Reflector Units shall be placed at an angle of approximately five degrees to a line parallel to the center-line of the highway.

In all instances a test shall be made to assure the position of the Reflector Units to be the most effective possible.

The diameter of holes drilled in the posts shall be drilled approximately one-sixteenth (1/16) inch less than the diameter of the signal button base. In all instances the hole shall be enough undersize that the button when driven into the post shall have complete bond with the post and be securely locked in correct position.

Posts shall be given a standard pressure Creosote treatment and then be thoroughly steam-cleaned in accordance with requirements of specifications.

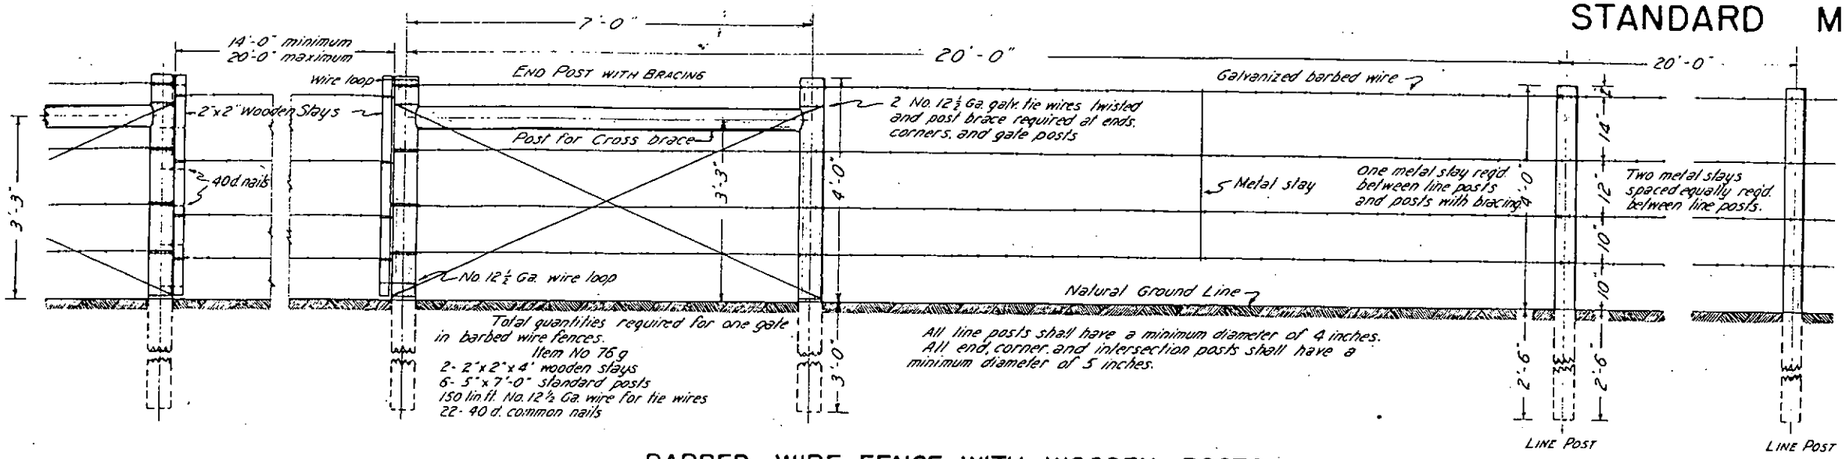
Rev. 6-20-40 - A.I. - 1940 Specs.

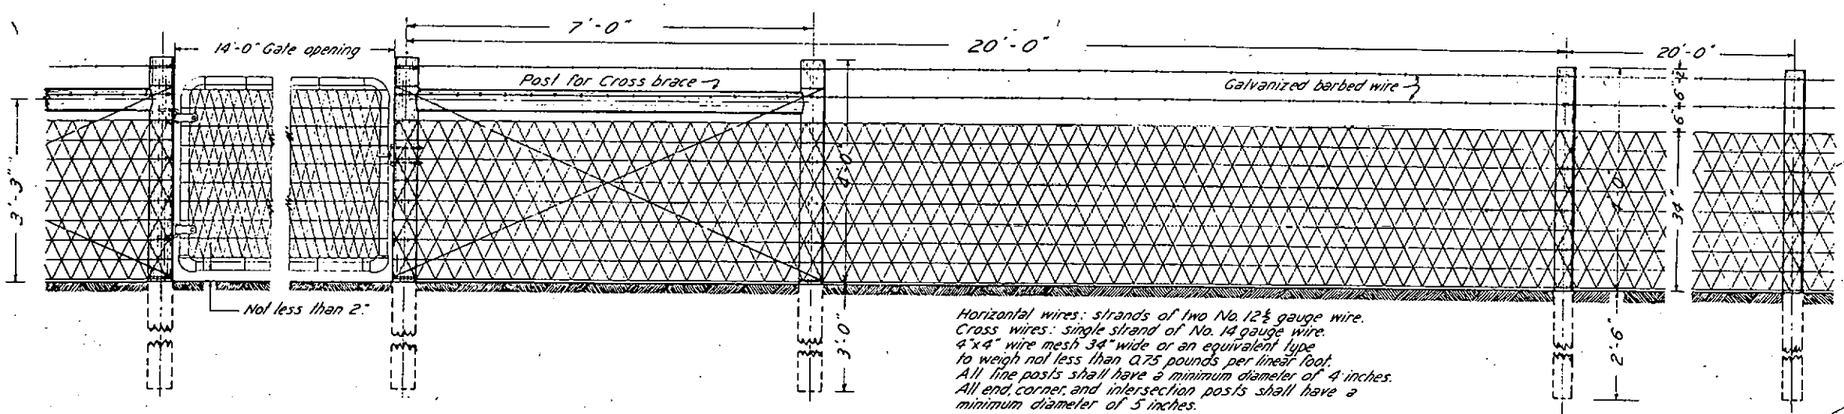


Total quantities required for one gate in barbed wire fences.
Item No. 76 g
2- 2"x2"x4' wooden stays
6- 5"x7'-0" standard posts
150 lin. ft. No. 12½ Ga. wire for tie wires
22- 40 d. common nails

All line posts shall have a minimum diameter of 4 inches.
All end, corner, and intersection posts shall have a minimum diameter of 5 inches.

BARBED WIRE FENCE WITH WOODEN POSTS

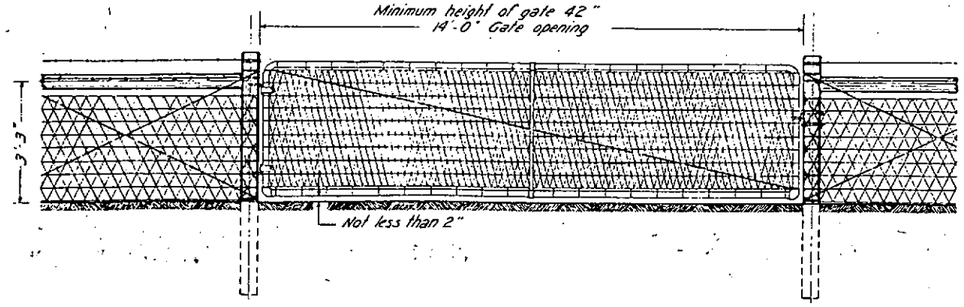
Item No. 76 a



Horizontal wires: strands of two No. 12½ gauge wire.
Cross wires: single strand of No. 14 gauge wire.
4"x4" wire mesh 34" wide or an equivalent type to weigh not less than 0.75 pounds per linear foot.
All line posts shall have a minimum diameter of 4 inches.
All end, corner, and intersection posts shall have a minimum diameter of 5 inches.

COMBINATION WIRE FENCE WITH WOODEN POSTS

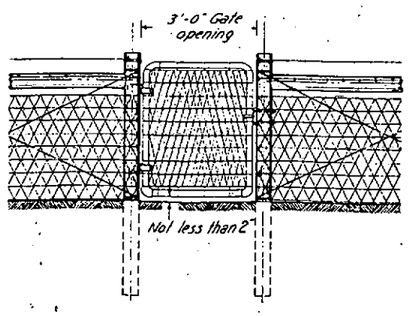
Item No. 76 d



DRIVEWAY GATE

Item No. 76 h

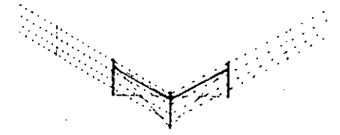
Gate complete with hinges and latch to weigh not less than 70 lbs.
2"x4" single strand wire mesh filler or an equivalent type.
Width of mesh approximately 40 inches.
Horizontal wires No. 10 gauge.
Cross wires No. 12½ gauge.
Galvanized metal latch and hinges.
Minimum 1" dia. galv. pipe frame or an equivalent.



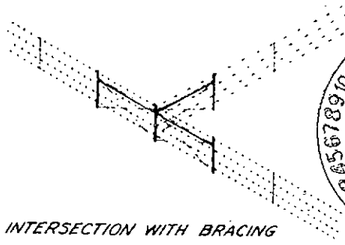
WALK GATE

Item No. 76 i

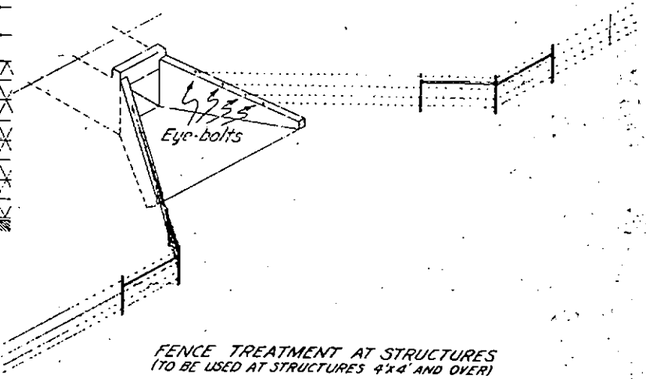
Gate complete with hinges and latch to weigh not less than 19 pounds.
2"x4" single strand wire mesh filler or an equivalent.
Width of mesh approximately 40 inches.
Horizontal wires No. 10 gauge.
Cross wires No. 12½ gauge.
Galvanized metal latch and hinges.
Minimum ¾ dia. galv. pipe frame or an equivalent.



CORNER POST WITH BRACING



FENCE INTERSECTION WITH BRACING



FENCE TREATMENT AT STRUCTURES
(TO BE USED AT STRUCTURES 4'x4' AND OVER)

End post with bracing shall conform to details shown above. (Three posts regd.)
Corner post with bracing shall consist of two end posts with bracing except that the post at the intersection of the two fence lines shall be common to both lines. (Five posts required.)
Fence intersection with bracing shall consist of three end posts with bracing except that the post at the intersection of the three fence lines shall be common to all three lines. (Seven posts regd.)

GENERAL NOTES

All work shall be done in accordance with the Standard Specifications of the Colorado State Highway Department, adopted June 1, 1940.

Barbed wire shall be of standard make, not lighter than No. 12½ gauge, galvanized, with two point barb spaced not more than five inches apart.

Wire mesh must be galvanized and not lighter than shown and noted on this plan.

Wire mesh used in driveway gates shall be painted with an approved waterproof asphalt or mineral paint.

Staples shall be at least 1½" long, made of No. 9 ga. wire base galvanized, 8 staples required per post for barbed wire fence and 14 staples per post for combination wire fence.

Cross braces to be securely nailed with four 40d. nails at each post.

End post with bracing to be used at all gates and fence ends.

Corner post with bracing to be used at all corners and angles in fences.

Fence intersection with bracing to be used at all intersecting fences.

At all structures of 4'x4' or over the fence shall be ended at eye-bolts in the wings of the structure. Where the type of construction prohibits the use of eye-bolts, an end post with bracing shall be used.

Eye-bolts are to be made from ½" round iron bars with a minimum of 6" of body length embedded in the concrete and a minimum of 1" inside eye diameter.

All wooden posts shall be made from seasoned, straight, sound Lodgepole Pine or Southern Yellow Pine, to be peeled and tops to be sawed off square before pressure treatment.

All posts shall be pressure treated with creosote in conformity with requirements given in the Specifications.

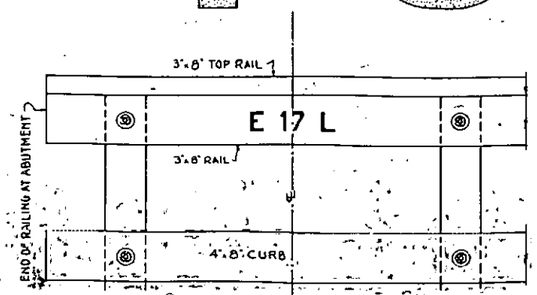
TYPICAL CONCRETE ENDPOST.



TYPICAL TIMBER WING

General Notes

ALL WORK SHALL BE DONE IN ACCORDANCE WITH THE STANDARD SPECIFICATIONS OF THE COLORADO STATE HIGHWAY DEPARTMENT ADOPTED JUNE 1-1940.

THE STRUCTURE NUMBER SHALL BE STENCILED ON THE RIGHT HAND SIDE OF EACH BRIDGE END AS SHOWN ON THIS STANDARD AND AS SPECIFIED.

THE CORRECT NUMBER FOR EACH BRIDGE IS SHOWN IN THE LOWER RIGHT HAND CORNER OF THE DETAIL SHEETS FOR THAT PARTICULAR BRIDGE.

THE SIZE, SHAPE AND SPACING OF THE LETTERS AND FIGURES SHALL BE IDENTICAL WITH THE FULL SIZE SHOWN ON THIS SHEET. ADDITIONAL COPIES OF THIS FULL SIZE SHEET CAN BE OBTAINED FROM THE DEPARTMENT WITHOUT CHARGE.

BEFORE STENCILING THE NUMBER ON THE BRIDGE, THE SURFACE MUST BE THOROLY CLEANED. A PROPER WHITE BACKGROUND SHALL BE PAINTED ON CONCRETE SURFACES. ON TIMBER HANDRAILS THE WHITE PAINT USED ON THE BRIDGE WILL BE SATISFACTORY. ON CONCRETE ENDPOSTS THE DRY CONCRETE SURFACE SHALL BE PROPERLY SIZED BEFORE PLACING THE WHITE RECTANGLE, UNLESS AN APPROVED WHITE CONCRETE PAINT IS USED.

TWO COATS OF ACCEPTABLE WHITE PAINT SHALL BE APPLIED TO THE CONCRETE IN A NEAT RECTANGULAR SHAPE AND EXTEND THREE INCHES BEYOND THE LIMITS OF THE STRUCTURE NUMBER.

AFTER THIS WHITE BACKGROUND HAS DRIED SUFFICIENTLY, THE CORRECT STRUCTURE NUMBER SHALL BE CAREFULLY STENCILED ON IT WITH TWO COATS OF STANDARD "SECOND FIELD" COAT DARK" AS SPECIFIED UNDER ITEM 41 "STEEL BRIDGES. THE BRACES OF THE STENCILED LETTERS AND FIGURES SHALL BE CAREFULLY FILLED IN BY HAND, TO MAKE SOLID FIGURES. SUFFICIENT TIME BETWEEN SUCCESSIVE COATS SHALL BE ALLOWED TO PERMIT THE PRECEDING COAT TO DRY.

THIS WORK WILL NOT BE PAID FOR AS A SEPERATE ITEM. COMPENSATION SHALL BE INCLUDED IN THE ORIGINAL CONTRACT ITEMS.

APPROVED JUN 1941 ENG. DIV. 2 S. H. D.

GENERAL NOTES

ALL WORK SHALL BE DONE IN ACCORDANCE WITH THE STANDARD SPECIFICATIONS OF THE COLORADO STATE HIGHWAY DEPARTMENT, ADOPTED JUNE 1, 1940.

THE SIZE, SHAPE AND SPACING OF THE NUMBERS SHALL BE IDENTICAL WITH THE FULL SIZE SHOWN ON THIS SHEET. ADDITIONAL COPIES OF THIS FULL SIZE SHEET CAN BE OBTAINED FROM THE DEPARTMENT WITHOUT CHARGE.

THIS WORK WILL NOT BE PAID FOR AS A SEPARATE ITEM. COMPENSATION SHALL BE INCLUDED IN THE ORIGINAL CONTRACT ITEMS.

THE YEAR NUMBER SHALL BE RECESSED INTO THE PANEL OF THE ENDPOST AT THE RIGHT HAND SIDE OF EACH BRIDGE END AND INTO THE FACE OF THE DOWNSTREAM HEADWALL OF CULVERTS, SYPHONS, RETAINING WALLS ETC. A MINIMUM OF 3/8" AS SHOWN.

THE YEAR NUMBER FOR EACH STRUCTURE SHALL CORRESPOND WITH THE PARTICULAR YEAR IN WHICH THE CONCRETE IS POURED.

NUMBERS TO BE MADE OF WOOD, METAL OR ANY OTHER SUITABLE MATERIAL AND ATTACHED TO THE FORMS BEFORE CONCRETE IS POURED.

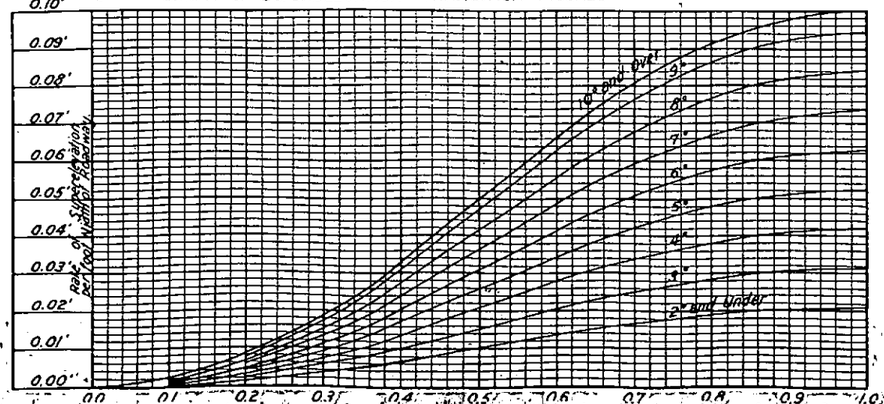
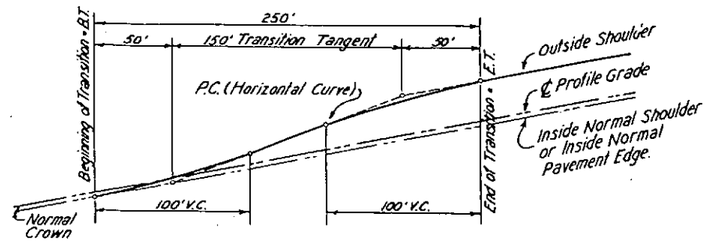
GRAPH OF SUPERELEVATION TRANSITION FIGURES



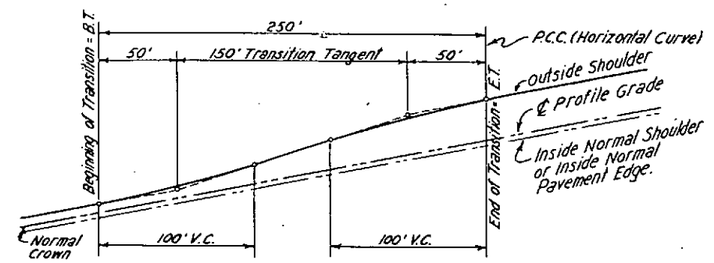
Proportion of Total Length of Transition including Vertical Curves (Normally 250 ft.)



CASE I: SIMPLE CURVE WITH UNLIMITED TANGENT APPROACH

NOTE: CASE I

The transition in this case, from crowned section to superelevated section, shall proceed uniformly by raising the outside shoulder, over a distance of 250 ft. as shown, beginning at a point on the tangent 150 ft. from the end of the curve and acquiring full superelevation at a point 100 ft. inside the curve.



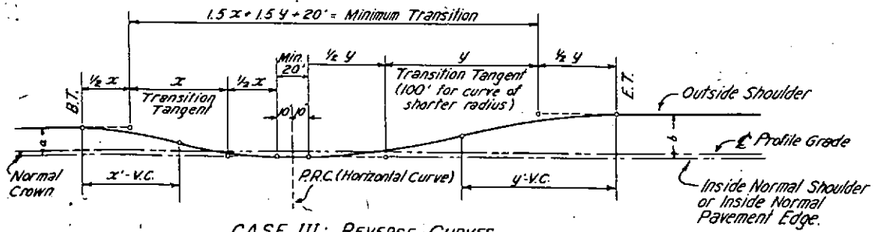
CASE II: COMPOUND CURVE

NOTE: CASE II

Superelevation transitions at the outside ends of compound curves shall be constructed in accordance with rules given under CASE I.

Superelevation transition between the arcs of different radii shall be made as in CASE I, except that the entire transition shall lie within the limits of the curve of the longer radius.

In cases where curves in the same direction have a tangent distance of less than 300 ft. between points of curve, the intervening tangent shall be superelevated an amount equal to that of the curve of greater radius and the transition shall be made as in the case of a true compound curve.



CASE III: REVERSE CURVES

NOTE: CASE III

Transitions between true reverse curves shall be accomplished as shown on the above diagram.

Transition tangents shall be directly proportional to the amount of superelevation of the respective curves.

EXAMPLE: Let a represent the amount of superelevation on 1st curve;
" b " " " " " 2nd "
" x " " " " transition tangent on 1st "
" y " " " " " 2nd "
then, a : b = x : y.

The transition tangent of the curve having the shorter radius shall be set at 100 ft.

A normal crowned section 20 ft. long, 10 ft. on each side of the P.R.C. shall be used.

In cases where curves in opposite directions are in such proximity that a standard transition can not be had, the practice outlined for true reversing curves shall be used.

The total distance between the P.T. of the first curve and the P.C. of the succeeding curve shall be prorated into the transition distance of the respective curves until a maximum of 150 ft. of transition tangent for each curve is achieved.

GENERAL NOTES

Curves on projects using the Sections shown are to be superelevated and widened as indicated in the accompanying drawings and tables.

The normal inside edge of the Pavement slab is to remain at the standard elevation of 0.125 ft. below the profile grade, and the outside edge of the slab is to be superelevated at the rate per foot width of roadway given in the table. The Section is to be rotated about the normal inside edge of the Pavement, with a 1½" parabolic crown for curves of 10° and under, and a flat crown for widened Sections.

The normal inside edge of the Graded or Surfaced Section is to remain at the standard elevation of 0.02 ft. per foot width of roadway below the profile grade, or as shown on the Typical Section for the Project. Also, the center-line pivot point is to be used until the superelevation equals 0.02 ft. per foot width of roadway, but when this elevation is exceeded the normal inside shoulder pivot point is to be used.

When the degree of curvature exceeds 10°, the inside edge of the Pavement slab or the inside shoulder of the Graded or Surfaced Section is to be widened from the normal inside edge or shoulder, respectively, as shown by the table and plan or by cross-sections. Curves of 10° or less are not to be widened.

The slope of the shoulders and widened sections shall conform to the rate per foot width of roadway required, except that the inside shoulder of paved sections shall maintain the Typical Section slope until this slope is exceeded by the required superelevation slope.

The outside ditch on superelevated Sections is to be modified, where necessary to provide drainage. Otherwise, this ditch shall conform to normal ditch section shown for Project.

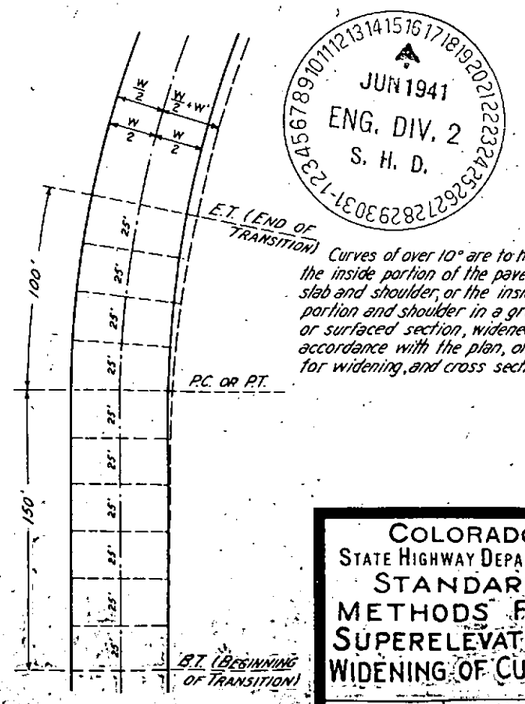
The rate of superelevation per foot width of roadway to be applied at the outside shoulder of the roadway is computed as follows:

The full superelevation per foot width of roadway rate for a given degree of curvature is

0.0105 ft. x Degree of Curvature.

The maximum superelevation of 0.10 ft. per foot width, applying to curves of 10° and over, is not to be exceeded.

Special transition problems not covered by this standard sheet shall be covered by appropriate notes included with curve data on plans.



GENERAL PLAN OF WIDENING

Curves of over 10° are to have the inside portion of the pavement slab and shoulder, or the inside portion and shoulder in a graded or surfaced section, widened in accordance with the plan, offsets for widening, and cross sections.

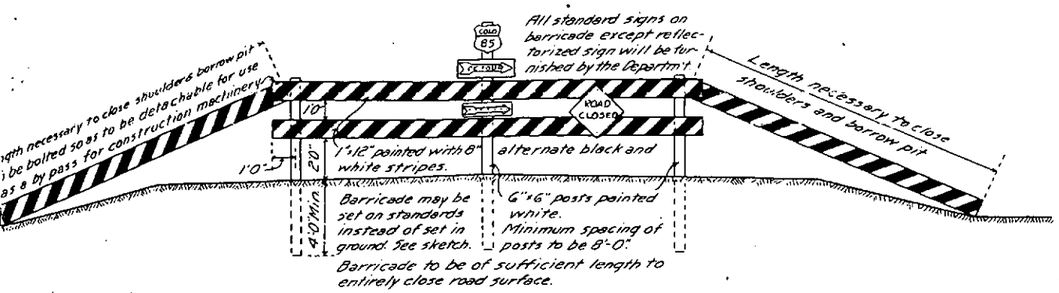
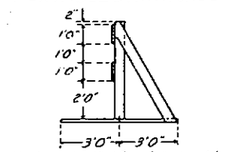
Revised 12-1-39 A.Z. Changed typical plans for side approach roads.
Revised 2-19-40 A.Z. Changed takeoff grades for side approach roads.
Rev. 6-28-40-A.Z.-1940 Specs.

DETAILS OF PERMANENT BARRICADE

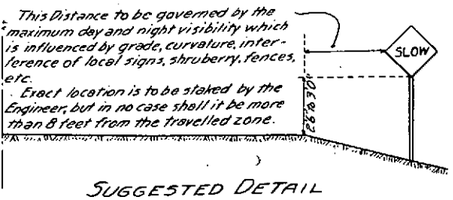


END VIEW OF PORTABLE BARRICADE



Posts to be 6"x6" painted white. Base and brace to be 2"x6", painted white, and nailed with 12d nails. Base to be weighted if necessary for stability.

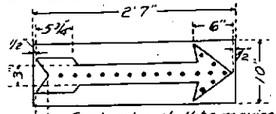
POSITION OF SIGNS RELATIVE TO ROADBED



This Distance to be governed by the maximum day and night visibility which is influenced by grade, curvature, interference of local signs, shrubery, fences, etc.

Exact location is to be staked by the Engineer, but in no case shall it be more than 8 feet from the travelled zone.

SUGGESTED DETAIL OF REFLECTORIZED ARROW

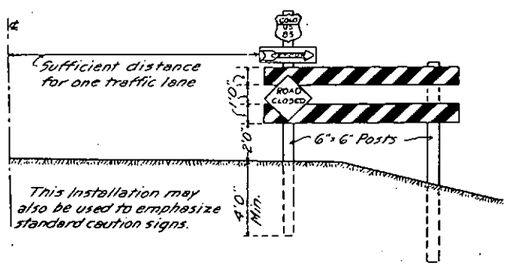


Contractor shall be required to have at least two such arrows for use on barricades at the ends of each project.

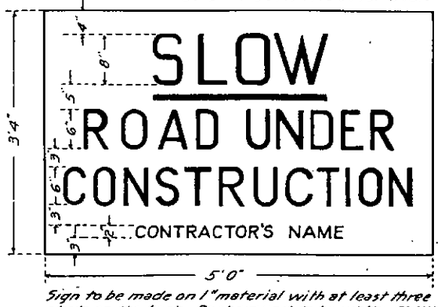
Reflector Buttons and Sign shall be subject to Department approval. Reflector Buttons shall be Signal Service ALA II (white crystal) or suitable equivalent.

Barricades to be placed as construction conditions require.

DETAILS OF PARTIAL BARRICADE



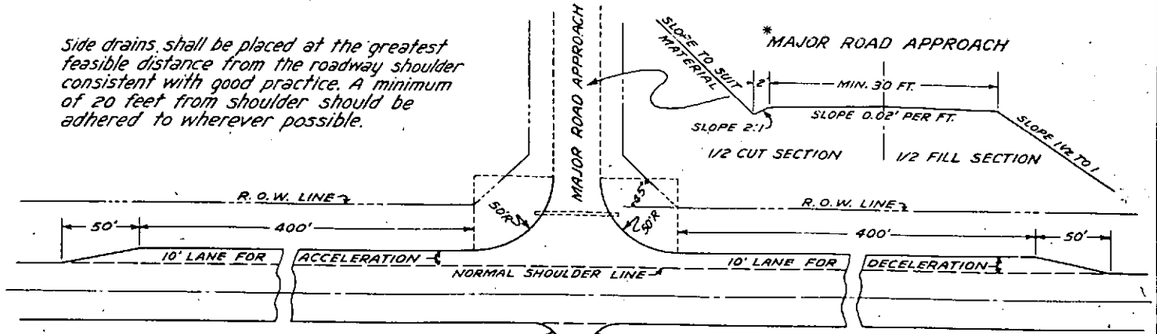
DETAILS OF ROAD UNDER CONSTRUCTION SIGN



Sign to be made on 1" material with at least three cleats on the back. Background to be white, SLOW and underline to be red, and other lettering to be black. Sign to be set on 2-6"x6" posts 4 ft. in the ground.

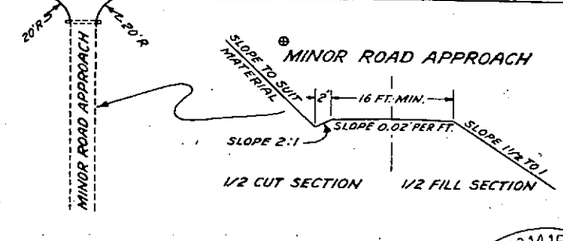
TYPICAL PLANS FOR SIDE APPROACH ROADS

Side drains shall be placed at the greatest feasible distance from the roadway shoulder consistent with good practice. A minimum of 20 feet from shoulder should be adhered to wherever possible.

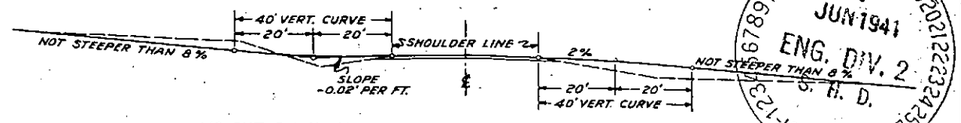


*Major Road Approaches shall be used only where indicated in structure notes on plans.

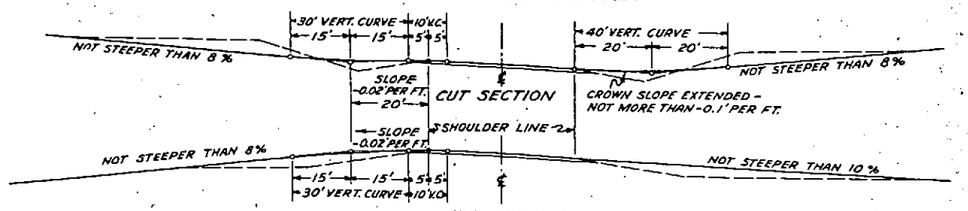
⊕Minor Road Approaches shall be used at all places which are not indicated as "Major Road Approaches." The width of crowned section shall not be less than the existing crowned width of the approaching road, but in no case shall it be less than 16 feet.



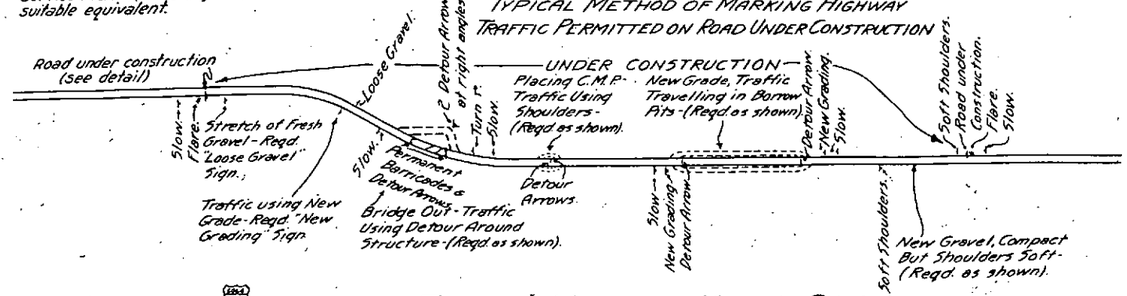
STANDARD CROWNED SECTION



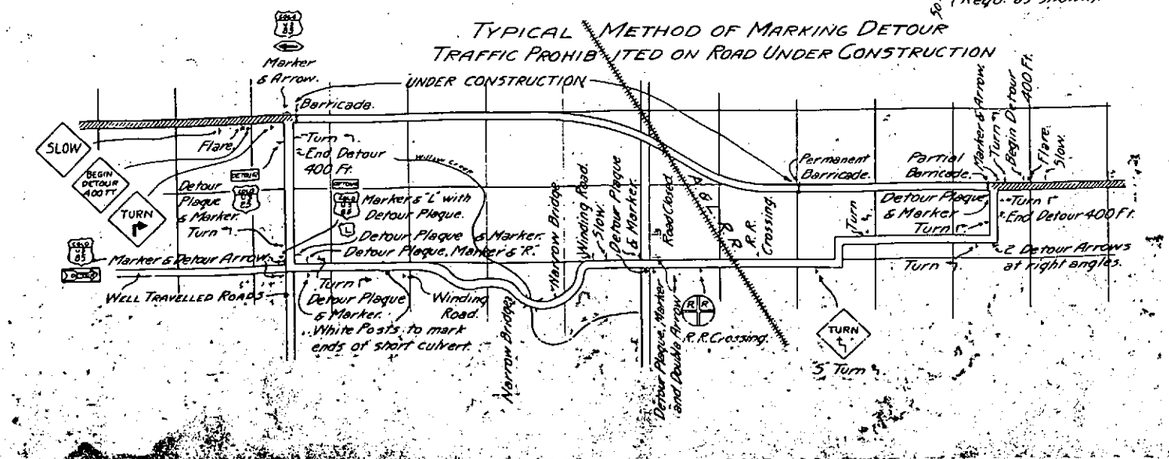
SUPERELEVATED SECTION



TYPICAL METHOD OF MARKING HIGHWAY TRAFFIC PERMITTED ON ROAD UNDER CONSTRUCTION



TYPICAL METHOD OF MARKING DETOUR TRAFFIC PROHIBITED ON ROAD UNDER CONSTRUCTION



GENERAL NOTES ON APPROACHES

The maximum grades shown are to be the limiting grades for all except extreme cases.

When the length of the approach as determined by the intersection of these grades with the natural ground is such as to damage the Property so served, or cause unreasonable conditions, the grades may be modified.

In such cases, methods used, and maximum grades, shall be as indicated on the plans, or provided by work order.

GENERAL NOTES FOR ROADWAY CONSTRUCTION TRAFFIC SIGNS

All Work shall be done in accordance with the Standard Specifications of the Colorado State Highway Department adopted June 1-1940.

Whenever traffic is permitted on a road while under construction, the Contractor shall at all times adequately and appropriately mark any and all hazards on the Project with well painted, well maintained barricades, and standard caution and warning signs. The Contractor shall also mark with standard directional signs any places where the direction of the flow of traffic is not plain.

Whenever traffic is prohibited from a Project under construction, the Detour will be marked by the Department and the barricades at either end of the Project shall be erected and maintained by the Contractor.

All signs and barricades shall be immediately moved, added to, removed, or changed to appropriately mark hazards, or conditions altered, corrected, or changed by construction progress.

The Contractor shall furnish:

(1.) All barricade material. It shall always be well painted, as per sketch, and well maintained.
(2.) A reflectorized arrow of an approved type for each barricade at the ends of the Project, and at other barricades required where traffic is permitted on road under construction.
(3.) "SLOW - ROAD UNDER CONSTRUCTION" signs as required.
(4.) Any special signs the Department may deem necessary for the protection of traffic over the Project.
(5.) At least three (3) flares or torches for each barricade, and other flares to illuminate such signs as are called for on these plans, or as the Department may direct.

Flares or torches shall be placed between 3 and 5 feet ahead of the sign or object to be illuminated, and shall be kept burning from sunset to sunrise.

Costs of all of the foregoing materials and work by the Contractor shall be included in the original contract prices for the Project.

The Highway Department will furnish all standard signs not required to be furnished by the Contractor.

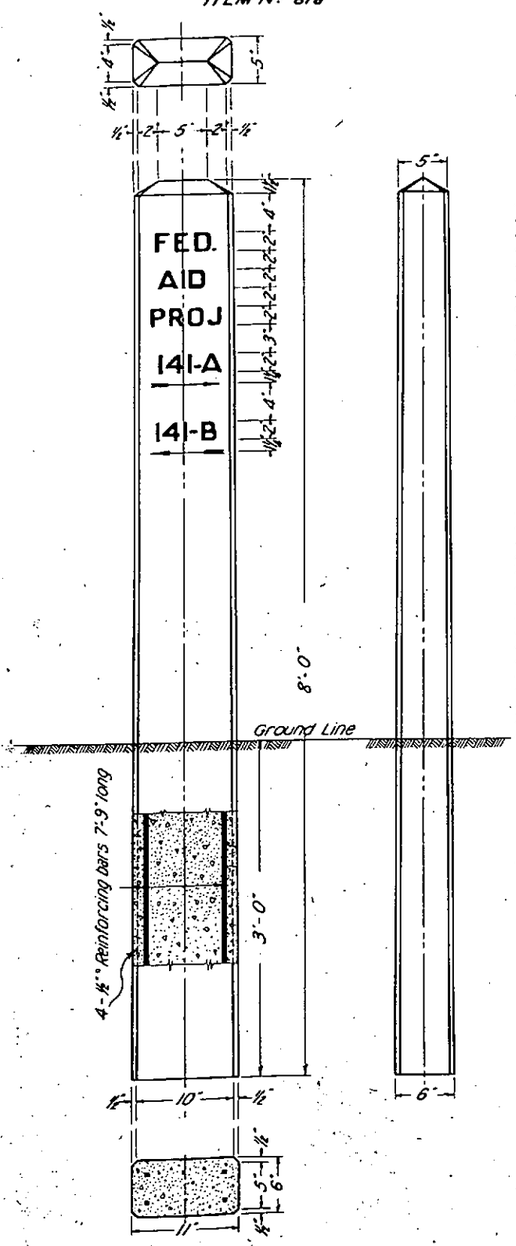
PROJECT MARKER POST

ITEM Nº 818



NOTES FOR PROJECT MARKER POSTS

All work shall be done in accordance with the Standard Specifications of the Colorado State Highway Department, adopted June 1, 1940.
Posts shall be made of Class "A" concrete, except use White Portland Cement.
All exposed surfaces shall be rubbed free of form marks.
All letters and numbers shall be 2" plain upright black, painted or stenciled on the concrete with a good quality of black paint. See item Nº 41, "Second Field Coat - Dark."
Numbers and arrows shall show the proper numbers and directions of the projects each way from where the post is placed.
Post to be set with sign facing the road at the end of the project, two feet inside the R.O.W. line or at a point amply protected from traffic in such a position that the sign will indicate properly the projects to which it refers.

NOTES FOR R.O.W. MARKER POSTS

All work shall be done in accordance with the Standard Specifications of the Colorado State Highway Department, adopted June 1, 1940.
Posts shall be made of Class "A" concrete.
The upper 12 inches of marker posts shall be rubbed free of form marks, and the top surface of the post must be constructed to drain thoroughly.
All exposed surfaces of the bronze tablet are to be ground to a smooth surface.
All letters are to be depressed a minimum of 1/8 inch.
Information on the bronze tablet indicated by pin lines is to be stamped in the field by the engineering party after post is placed; 3/8 inch letters and figures to be used.
Project designations on tablets shall be properly shown. Thus: F.A.P. Nº for Federal Aid Projects, "S.P.N.º" for State Projects, P.W.A. Nº for P.W.A. Projects, etc.

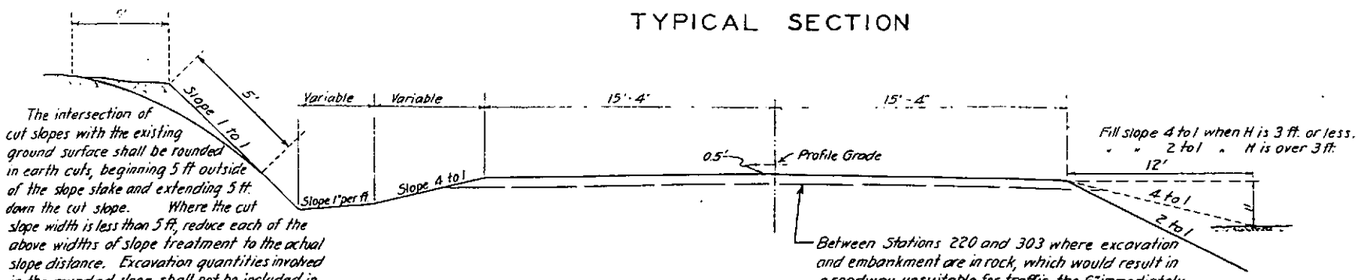
TYPICAL CROSS SECTION OF IMPROVEMENT AND SUMMARY OF QUANTITIES

Rev. 3-11-34 A.J.S.
REV. 12-19-34 F.W.D.
" 1-19-35 A.J.S.
Rev. for Const. Div. No. 2 and Elimination of Gravel 1-23-35 H.S.C.

TYPICAL SECTION



The intersection of cut slopes with the existing ground surface shall be rounded in earth cuts, beginning 5 ft outside of the slope stake and extending 5 ft. down the cut slope. Where the cut slope width is less than 5 ft, reduce each of the above widths of slope treatment to the actual slope distance. Excavation quantities involved in the rounded slope shall not be included in "Unclassified Excavation".

Between Stations 220 and 303 where excavation and embankment are in rock, which would result in a roadway unsuitable for traffic, the 6" immediately underlying the subgrade, as shown on the Typical Section, is to be constructed of selected material which is to be classified and paid for as Unclassified Excavation. Selected material is available approximately 0.7 mi. north of Sta. 303.

GENERAL NOTES

This project is to be constructed in conformity with the Standard Specifications of the Colorado State Highway Department, adopted January 1, 1930.

All quantities on preliminary plans are to be considered approximate only.

All roadway excavation required to construct the project is to be obtained as indicated on the Plans. Quantities involved beyond the limits of ditch as shown on the Typical Section, either noted as "Borrow" on the Plans or as "Embankment" on the Structure List, are to be classified and paid for as "Unclassified Excavation." These quantities are to be staked as part of the original excavation at locations indicated on the plans. Any slope stakes beyond the limits of the typical ditches are subject to change by the Engineer to fit embankment requirements actually encountered during construction.

All curves are to be superelevated in accordance with methods shown on the Standard Superelevation Sheet.

At all places on the project where the new work lies along the present traveled road the contractor shall at his own expense so prosecute construction that traffic may readily pass over the road. Also the contractor shall maintain in safe condition and at his own expense all temporary approaches and crossings of intersecting roads.

Except as limited by the special provisions power equipment may be used on this work.

SECTIONAL PLAN "A-A"

INTERCEPTING HEADWALLS.

GENERAL NOTES FOR ALL STRUCTURES

ALL WORK SHALL BE DONE ACCORDING TO THE STANDARD SPECIFICATIONS OF THE COLORADO STATE HIGHWAY DEPARTMENT, ADOPTED JAN 1, 1930.
ALL CONCRETE SHALL BE CLASS "A" EXCEPT TYPES A & B WHICH SHALL BE CLASS "B".
ALL EXPOSED SURFACES SHALL BE RUBBED FREE OF FORM MARKS.
ALL EXPOSED CORNERS SHALL BE BEVELED TO A 2" FACE.
ALL CONSTRUCTION JOINTS SHALL BE THOROUGHLY CLEANED BEFORE FRESH CONCRETE IS POURED.
ALL WALLS SHALL HAVE FORMS ON BOTH SIDES.
ALL REINFORCING BARS SHALL BE ROUND OR SQUARE, AS SHOWN & NOTED.
ALL REINFORCING BARS SHALL BE TAGGED WITH THE STATION NUMBER AND LETTER DESIGNATION.
SECONDARY BARS WHEN SPLICED SHALL BE GIVEN A LAP OF 50 DIAMETERS.
MAIN BARS SHALL NOT BE SPLICED.
MINIMUM FILL OVER TOP OF CULVERTS SHALL BE 1'-0".
WHEN CULVERT IS SKEWED HEADWALLS SHALL BE PLACED PARALLEL TO ℄ OF ROADWAY.
MINIMUM GRADE OF PIPE SHALL BE 1%.
FOR SIZE AND LOCATION OF CULVERTS SEE SHEET NO. 2.
FOOTINGS IN ROCK SHALL BE POURED OUT TO THE ROCK AND NOT FORMED.

Cross Wires № 12½ Gauge.
Galvanized Metal Latch and Hinges.

ELEVATION OF WALK GATE.
ITEM № 95 c.

GENERAL NOTES FOR WIRE FENCES.

All work shall be done in accordance with the Standard Specifications of the Colorado State Highway Department, Adopted January 1-1930.
Barbed wire shall be of Standard Make, not lighter than № 12½ Gauge, Galvanized and with Two Point Barbs spaced not more than 5" apart.
Wire Mesh must be galvanized and not lighter than shown and noted on this plan.
Wire Mesh used in Driveway Gates shall be painted with an approved waterproof asphalt or mineral paint.
Staples shall be at least 1½" long, made of № 9 Gauge Wire Base Galv. 8 staples req'd per post for barbed wire fence and 14 Staples per post for Combination Wire Fence.
All Wooden Posts shall be made from seasoned, straight, sound Native Cedar.

RIGHT OF WAY MARKER POST.
ITEM № 79.

NOTES FOR PROJECT MARKER POSTS.

All Letters and Numbers shall be 2" Plain Upright Block, Painted or Stenciled on the Concrete with a good quality of Black Paint. See Item № 41 "Second Field Coat-Dark."
Numbers and arrows shall show the proper numbers and directions of the projects each way from where the post is placed.
Post is to be set with sign facing the road at the end of the project, five feet beyond edge of shoulder in such a position that the sign will properly indicate the projects to which it refers.
All work shall be done in accordance with Standard Specifications of the Colorado State Highway Department, adopted on Jan. 1, 1930.
Posts shall be made of Class "B" Concrete (Slump 3" to 4") except use White Portland Cement.
All exposed surfaces shall be rubbed free of form marks.

NOTES FOR R.O.W. MARKER POSTS.

All work shall be done in accordance with Standard Specifications of the Colorado State Highway Department, adopted on Jan. 1, 1930.
All exposed surfaces of the Bronze Tablet are to be ground to a smooth surface.
All letters are to be depressed a minimum of 1/16 inch.
Information on the Bronze Tablet indicated by pin lines is to be stamped in the field by the engineering party, after post is placed. 3/16" letters & figures to be used.
Posts shall be made of Class "A" Concrete.
The upper 12 inches of marker shall be rubbed free of form marks, and the top surface of marker must be constructed to drain thoroughly.

PAVEMENT SECTION

SUPERELEVATION AND WIDENING NOTES FOR PAVEMENT SECTION

Curves on projects using the pavement section are to be superelevated and widened as indicated in the accompanying drawings and table.

The normal inside edge of the pavement slab is to remain at the standard elevation of 0.125 ft. below the profile grade, and the outside edge of the slab is to be superelevated at the rate per foot width of roadway given in the table or graph. The section is to be rotated about the normal inside edge of the pavement.

When the degree of curvature exceeds 10, the inside portion of the pavement slab is to be widened from the normal inside edge as per the table below. Curves of 10° or less are not to be widened. The 1½" parabolic crown is to be used for curves of 10° and under. The widened section is to have a flat crown.

The slope of the shoulders shall conform to the rate per foot width of roadway required except that the inside shoulder shall maintain the standard slope of 0.0417 ft. per foot width until the superelevation rate exceeds this standard slope.

The outside ditch along a superelevated section is to be modified from the standard where a deeper ditch is required to provide drainage.

Details of plans for superelevating and widening are shown on the General Plan for Widening and the Graph of Superelevation Factors.

The subgrade for future pavement is to be constructed to conform to the superelevation and widening requirements for the pavement section.

GRADED OR SURFACING SECTION

SUPERELEVATION AND WIDENING NOTES FOR GRADED OR SURFACING SECTIONS

Curves on projects using the graded or surfacing section are to be superelevated and widened as indicated in the accompanying sketches and table.

The normal inside shoulder and ditch are to remain as shown in the typical section shown on sheet #2. The outside shoulder is to be the high point of the section.

The outside ditch along a superelevated section is to be modified from the standard where a deeper ditch is required to provide drainage.

The center line pivot point is to be used as long as the superelevation does not exceed 0.02 feet per foot width of roadway. The normal inside shoulder pivot point is to be used for a superelevation rate in excess of 0.02 ft. per foot width of roadway.

When the degree of curvature exceeds 10° the inside shoulder is to be widened from the normal inside shoulder line as shown by the table and cross section. Curves of 10° and less are not to be widened.

Details of plans for superelevation and widening are shown on the General Plan for Widening and the Graph of Superelevation Factors.

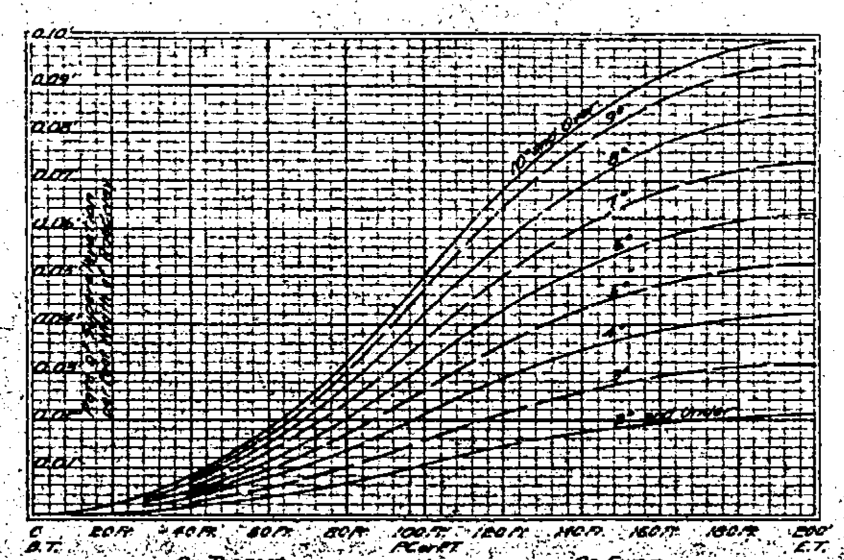
Curves of over 10° are to have the inside portion of the pavement slab and shoulder, or the inside portion and shoulder in a graded or surfacing section, widened in accordance with the plan, offsets for widening, and cross sections.

In the graph below the values for the graph labeled "10° and Over," multiplied by 1,000 gives the percentage of the total widening at any point on the transition.

GENERAL PLAN FOR WIDENING



GRAPH OF SUPERELEVATION TRANSITION FACTORS

The rate of superelevation per foot width of roadway to be applied at the outside edge of the pavement slab and at the outside shoulder of the roadway is computed as follows:

The full superelevation per foot width of roadway rate for a given degree of curvature is

0.0105 ft. x degree of curvature.

The maximum superelevation of 0.10 ft. per foot width, applying to curves of 10° and over, is not to be exceeded.

The above graph has been prepared from the rates of superelevation shown in the tabulations.

SPECIAL CASES: When the roadway alignment does not permit the use of the 200 ft. transition lengths, the required lengths may be proportionately shortened. A minimum distance of 200 ft. between the points of full superelevation shall be used.
