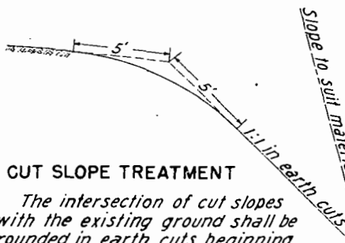
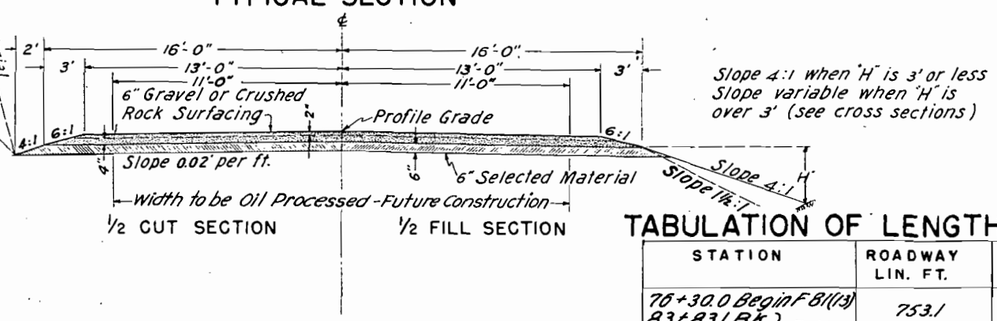
TYPICAL CROSS SECTION OF IMPROVEMENT AND SUMMARY OF QUANTITIES



CUT SLOPE TREATMENT

The intersection of cut slopes with the existing ground shall be rounded in earth cuts beginning 5 ft. outside the cut slope and extending 5 ft. down the cut slope. Where the cut slope is less than 5 ft., reduce each of the above widths of slope treatment to the actual slope distance. Quantities involved in Cut Slope Treatment shall be included in "Unclassified Excavation."

TYPICAL SECTION



Slope 4:1 when "H" is 3' or less
Slope variable when "H" is over 3' (see cross sections)

NOTE:
GRAVEL SURFACING AND SELECTED MATERIAL WILL BE PLACED UNDER FUTURE CONSTRUCTION.

GENERAL NOTES

This Project is to be constructed in conformity with the Standard Specifications of the Colorado State Highway Department adopted June 1, 1940.

All quantities on preliminary plans are to be considered approximate only.

All roadway excavation required to construct this project is to be obtained as indicated on the plans. Quantities involved beyond the limits of the ditch, as shown on the Typical Section, either noted on the profile as "Borrow" or on the List of Structures as "Embankment" are to be classified and paid for as "Unclassified Excavation". These quantities are to be staked as part of the original excavation at locations indicated on the plans. Slope stakes beyond the limits of the Typical Section as shown, are subject to change by the Engineer to fit conditions actually met in construction.

Except as otherwise noted on the plans, payment for overhaul will be based on measurement along the centerline of the Project.

All curves are to be superelevated and widened as provided for by the Standard Superelevation Sheet except as otherwise noted on plans.

Curves on this Project over 5 degrees shall be provided with the Superelevation shown on the Standard Superelevation sheet for a 5 degree curve.

If excavation operations develop material which will stand on slopes steeper than slope stake lines, the Department reserves the right to change cut slopes during the progress of such excavation.

The entire project shall be cleared in conformity with the requirements of the Standard Specifications except that such trees or shrubs as the Engineer may designate shall be left in place and protected from damage during construction operations.

The depth and width of the side ditch shall be varied where necessary in order to provide proper drainage and entrance to cross drainage structures.

All Corrugated Metal Pipe Culverts including Arches shall be laid with Metal Aprons on each end unless otherwise noted on the plans.

Approximately 6 inches of embankment material will be used to cover culverts in such a manner that a minimum of pipe shall be exposed in the completed work. This shall be accomplished by warping embankment slopes around and adjacent to the culvert.

SUPERELEVATED SECTION

TYPICAL TUNNEL SECTIONS

GENERAL NOTES

All work shall be done in conformity with Standard Specifications of the Colorado State Highway Department adopted June 1, 1940.

The Contractors attention is directed to the fact that the quantities of certain items involved in the construction of the tunnel bores are subject to material revision as construction progresses. Quantities of items involved in tunnel construction may be materially increased, decreased or entirely eliminated depending on conditions actually encountered.

Typical timbering methods are shown hereon, but the arrangement, spacing and size of members shall be varied to meet construction requirements. Timbering methods for each type of ground encountered must be submitted by the Contractor, for approval by the Department before permanent timbering operations may proceed.

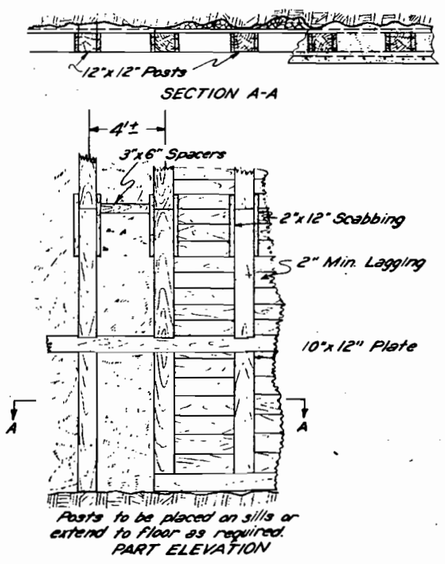
Excavation for tunnels shall be started at the lower end and shall be in accordance with plan details. Portal cuts shall be entirely removed before the beginning of any tunnel excavation opperations.

In concrete lined sections ¾" ϕ reinforcing bars at one(1) ft centers shall be used both longitudinally and on the circumference of the tunnel. Bars shall be placed a minimum of 3 inches from the face of the concrete and where spliced shall be lapped a minimum of 50 diameters. All reinforcing bars shall be deformed.

For purpose of estimating only, the following assumptions are used in arriving at quantities for tunnel Lining:

Timber and Concrete Tunnel Lining 220 Lin.ft.
Gunite Lining 639 Lin.ft.

Note:
Curb and Gutter, Sidewalks and Pavement will be placed under future construction.



DETAILS OF TUNNEL LINING

The normal inside shoulder elevation is to remain at the standard elevation of 0.02 feet per foot width of roadway below the profile grade. Minimum Clearance shall be maintained on curves by raising the Horizontal Line of the Tunnel Section a distance sufficient to provide for superelevation of the Roadway.
